General Comments

As discussed below, Sempra Generation requests that the CAISO confirm that the “Devers-Palo Verde 500 kV T/L #2 (DPV2)” transmission project is included in the annual reliability study performed as part of the 2010 CAISO Transmission Plan. In particular, we request that CAISO confirm that both the Arizona and California portions of DPV2 are included in the annual study.

Chapter 2 of the Draft 2010 CAISO Transmission Plan describes the assumptions and methodology relied on by the CAISO in performing its annual reliability study. Section 2.3.2.5, which addresses the specific transmission projects included in the annual study, states as follows:

“The study included all existing transmission projects in service, and the expected future transmission projects that had received ISO approval for interconnection in accordance with the project approval status list in the 2009 ISO TP <http://www.caiso.com/2354/2354f34634870.pdf>. Refer to appendix A for the list of transmission projects modeled in the base cases.” (p. 15)

The list of transmission projects identified in the above-referenced appendix A includes “Devers-Palo Verde 500 kV T/L #2 (DPV2)” (see Item No. 84). As a future transmission project that has previously received CAISO approval, Sempra Generation requests that the CAISO confirm that both the Arizona and California portions of the DPV2 transmission project are included in the above-referenced annual study.
