California ISO solar production soars to new record - 8,030 megawatts Clean energy now consistently serves large percentage of consumer demand

FOLSOM, Calif. – Solar power production hit a new record of 8,030 megawatts at 1:06 p.m. Tuesday, July 12, 2016. This is nearly twice the amount of solar energy produced in mid-2014 and nearly 2,000 megawatts higher than in May 2015.

“This solar production record demonstrates that California is making significant strides forward in connecting low carbon resources to the grid in meeting the state’s goal of reaching 33 percent renewables by 2020,” said ISO President and CEO Steve Berberich. “California continues to lead the nation in adding clean resources to the system and writing a playbook for operating a low carbon grid.”

Solar and wind combined with the other Renewables Portfolio Standard resources to provide nearly 29 percent of the electricity needs at Tuesday’s system peak, which occurred at 5:54 p.m. For short periods of time on May 14 and 15, 2016, renewables were serving 54 percent and 56 percent of demand, respectively.

California leads the nation interconnecting renewable resources with total clean capacity as of this date about 18,718 megawatts. Solar resources make up nearly 8,600 megawatts while wind resources total about 6,000 megawatts, which compose one-third of all renewables on the grid. Geothermal, biofuels, small hydro-electricity and energy storage round out California’s renewables portfolio standard resources.

Thanks for re-posting!

The California ISO provides open and non-discriminatory access to one of the largest power grids in the world. The vast network of high-voltage transmission power lines is supported by a competitive energy market and comprehensive grid planning. Partnering with over a hundred clients, the nonprofit public benefit corporation is dedicated to the continual development and reliable operation of a modern grid that operates for the benefit of consumers. Recognizing the importance of the global climate challenge, the ISO is at the forefront of integrating renewable power and advanced technologies that will help meet a sustainable energy future efficiently and cleanly.
