Decision on hybrid resources phase 2 proposal

Greg Cook
Executive Director, Market and Infrastructure Policy

Board of Governors Meeting
General Session
November 18, 2020
The hybrid resources initiative includes two different models for generation with different technology types at the same location

- **Co-located resource model** – Individual resource ID for each generator behind a single point of interconnection
  - Each component will be modelled similar to other resources on the grid today
  - Approved by Board in July, Fall 2020 implementation

- **Hybrid resource model** – A single resource ID aggregating multiple generators at a single point of interconnection
  - ISO has visibility to a single resource which can allow flexibility for hybrid resource management
  - ISO Board decision in November, Fall 2021 implementation
The Phase 2 proposal provides enhanced market rules for hybrid resources and additional provisions for co-located resources

• New provisions for managing hybrid resources
  – Allows for hybrid resources to provide ancillary services
  – Enables hybrid resources to communicate their generation availability in real-time through new functionality

• Enhanced functionality to responsibly integrate co-located resources
  – Allow co-located resources to provide ancillary services
  – Allow co-located storage resources to deviate from dispatch instructions under certain conditions to avoid renewable curtailment

• Facilitate hybrid wind and solar resource forecasting by collecting new data from hybrid and co-located resources
Proposal includes a new dynamic limit tool for hybrid resource operators to convey real-time operating limits

- Hybrid resources face unique challenges operating a mix of resources under a single resource ID
  - Physical output limits based on combined resource capabilities of wind or solar and storage component

- The **dynamic limit tool** enables the unique nature of hybrid resources to inform the ISO of expected real-time capability
  - This new tool conveys information to ISO operators on the upward and downward capability of the hybrid resource
  - Helps ensure ISO issues feasible dispatches to hybrid resources
Allow co-located storage resources to deviate from dispatch instructions under limited conditions to avoid renewable curtailment

• Storage component would be allowed to produce less than dispatch (charge) under the following conditions:
  – The co-located VER resource must be producing above dispatch
  – The co-located resources would otherwise be producing above point of interconnection limits
  – The co-located resources may not be providing ancillary services

• Information sharing necessary to facilitate the deviation would be borne by the co-located resource operators

• Resource deviations would be settled as uninstructed energy
Proposal includes new provisions for collecting data from wind and solar components for forecasting needs

- ISO will require high sustainable limit data from wind and solar components that are either co-located or part of a hybrid resource
  - Provides real-time telemetry data on the maximum expected output of the wind or solar components

- This information will be used to forecast potential output of wind and solar hybrid resource components
Stakeholders largely support Management’s Hybrid Phase 2 Proposal

• Most stakeholders recognize that proposal provides new market tools for an emerging technology
  – Quick delivery is necessary to accommodate new resources
  – Feedback from stakeholders was instrumental in developing a more workable dynamic limit tool

• Some stakeholders raised concerns about resource adequacy provisions for hybrid resources

• Stakeholders continue to advocate for additional functionality for operating co-located resources
  – Management will begin policy work to consider extending the hybrid and co-located constructs in the summer of 2021
Management requests the Board approve the hybrid resources phase 2 proposal

- Hybrid proposal provides improved functionality to allow resources located at the same point of interconnection to provide ancillary services.
- Policy improves forecasting with a telemetered estimate of generating capabilities for wind and solar components of hybrid and co-located resources.
- Policy introduces new tools necessary for hybrid resources to operate in the market and receive feasible dispatch instructions from the ISO market.
