**REPLY TESTIMONY OF DR. KARL MEEUSEN
ON BEHALF OF
THE CALIFORNIA INDEPENDENT SYSTEM OPERATOR CORPORATION
R.20-11-003**

1 **I. INTRODUCTION**

2 **Q1. Have you previously provided testimony in this proceeding?**

3 **A1.** Yes, I provided opening testimony on January 11, 2021. My professional background is
4 provided therein.

5
6 **Q2. What is the purpose of your reply testimony?**

7 **A2.** My reply testimony addresses the following issues:

8 (1) The need to increase the planning reserve margin to provide the CAISO effective
9 backstop authority for summer 2021 needs;

10 (2) The potential role of the CAISO’s Significant Event Capacity Procurement
11 Mechanism (CPM) in meeting summer 2021 needs; and

12 (3) How to effectively use emergency load reduction program (ELRP) and demand
13 response resources to meet summer 2021 needs.

14

15 **II. INCREASING THE PLANNING RESERVE MARGIN**

16 **Q3. Several parties suggest that the Commission need not increase the planning reserve
17 margin to meet summer 2021 reliability needs. Please explain how the proposed
18 increase in the planning reserve margin provides the appropriate solution to best
19 meet 2021 reliability requirements.**

20

21 **A3.** Increasing the planning reserve margin will allow the CAISO to exercise its CPM to
22 address any monthly resource adequacy capacity showing deficiencies. If the
23 Commission directs increased capacity procurement for 2021—without an attendant
24 increase in the planning reserve margin—the CAISO will not have authority to issue a
25 monthly deficiency CPM if the incremental capacity is not procured. Specifically, under
26 Section 43A.2.3 of the CAISO tariff, the CAISO has authority to designate CPM capacity
27 only when load serving entities are deficient in meeting their “annual and monthly
28 Demand and Reserve Margin Requirements.”¹ Even if the Commission requires
29 additional procurement, the CAISO would not have authority to issue a monthly CPM to

¹ CAISO Tariff Section 43A.2.3.

**REPLY TESTIMONY OF DR. KARL MEEUSEN
ON BEHALF OF
THE CALIFORNIA INDEPENDENT SYSTEM OPERATOR CORPORATION
R.20-11-003**

1 address a deficiency in load serving entities' resource adequacy showings because the
2 incremental procurement requirement would not be part of the monthly "Demand or
3 Reserve Margin Requirements."

4
5 **III. CAISO SIGNIFICANT EVENT CPM AUTHORITY**

6 **Q4. Do you agree with PG&E's suggestion that the CAISO modify its business practice**
7 **manual (BPM) to increase its Significant Event CPM authority?**

8 **A4.** No. As I explained in opening testimony, the CAISO's Significant Event CPM authority
9 is limited and well-defined in the CAISO tariff. The CAISO cannot expand its tariff-
10 defined Significant Event CPM authority through a BPM change. Rather, any
11 substantive change would require a CAISO tariff amendment. In any event, Significant
12 Event CPM authority is clearly not intended or designed to be a substitute to properly
13 establishing necessary and appropriate PRM levels and resource adequacy procurement
14 obligations to reflect current realities and foreseen circumstances.

15
16 **IV. DEMAND RESPONSE AND LOAD REDUCTION ISSUES**

17 **Q5. SCE expresses concerns regarding double payments in situations where an ELRP**
18 **event's hours overlap with another demand response program's event hours. Are**
19 **there other concerns that must be addressed for participation in both an IOU**
20 **resource adequacy DR program and an ELRP?**

21
22 **A5.** The CAISO agrees the Commission should prohibit double payments to ELRP
23 participants, but the Commission must also be cognizant of double capacity counting and
24 crediting. In my opening testimony, I expressed concerns about "dual participation" for
25 capacity counting reasons. The CEC load forecast will capture ELRP load curtailment as
26 a load modifier rather than as a supply-side resource under the resource adequacy
27 demand response program. Ensuring there is no double counting of capacity is critical
28 and should be an important consideration in designing the ELRP, planning its interaction
29 with other resource adequacy demand response eligible programs, and ensuring that
30 ELRP megawatts are incremental and distinguishable from other resource adequacy
31 demand response program megawatts.

**REPLY TESTIMONY OF DR. KARL MEEUSEN
ON BEHALF OF
THE CALIFORNIA INDEPENDENT SYSTEM OPERATOR CORPORATION
R.20-11-003**

1

2 **Q6. Do you agree with SCE’s assertion that “there is no reason to specify whether the**
3 **ELRP should be dispatched before or after the BIP”?**

4

5 **A6.** The Commission should adopt a “resource adequacy first” principle for the dispatch of
6 resource adequacy resources prior to calling on non-resource adequacy resources such as
7 the ELRP. Load serving entities have paid for resource adequacy resources to be
8 available, visible and dispatchable by the CAISO to maintain system reliability.
9 Accordingly, these “paid-for” resource adequacy resources should be dispatched and
10 used first before calling on non-resource adequacy ELRP resources.

11

12 “Resource adequacy first” is an important principle for several reasons. First, the CAISO
13 should have a clear idea of how much available resources are available to meet the
14 CAISO’s reliability needs and should not have to wait to see how well a voluntary
15 program, such as ELRP, performs before dispatching resource adequacy resources.
16 Additionally, given the dual participation concerns discussed above, dispatching ELRP
17 before resource adequacy resources could reduce the demand response potential the
18 CAISO expects from BIP and other resource adequacy demand response resources if the
19 megawatts between the ELRP and resource adequacy demand response resource are not
20 clearly incremental or if the customer receives multiple calls causing customer fatigue.
21 As noted in my opening testimony, ELRPs should be considered as an insurance
22 program, and, like insurance, should only be used when all else fails. In other words,
23 resource adequacy resources should be fully dispatched to prevent an emergency
24 condition in the first instance, and then non-resource adequacy options, like the ELRP,
25 can be called after or simultaneously to ensure an emergency condition or serious threat
26 of an emergency doesn’t grow worse given all resource adequacy options have been
27 exercised.

28

29 In addition to the aforementioned reliability concerns, there are cost and environmental
30 reasons for adopting a “resource adequacy first” principle. The system and ratepayers

**REPLY TESTIMONY OF DR. KARL MEEUSEN
ON BEHALF OF
THE CALIFORNIA INDEPENDENT SYSTEM OPERATOR CORPORATION
R.20-11-003**

1 should not incur additional costs and pay for ELRP resources if already compensated
2 resource adequacy resources are still available and undispached. Utilizing non-resource
3 adequacy demand response resources first would degrade the cost-effectiveness of the
4 resource adequacy product ratepayers paid for by potentially reducing its intended use
5 and without considering the costs of the ELRP.

6
7 Finally, the demand response programs used to provide resource adequacy are not
8 allowed to rely on prohibited resources, like back-up diesel-fired generators. If the ELRP
9 is allowed to use prohibited resources, then the “resource adequacy first” principle for
10 resource adequacy demand response is that much more important, potentially preventing
11 the unnecessary use of diesel or other fuel-backed emergency generating resources.

12
13 As I noted in my opening testimony, if the Commission adopts an ELRP dispatch trigger
14 that would precede existing resource adequacy demand response program triggers, then it
15 should also advance the triggers of the existing resource adequacy demand response
16 programs so that the resource adequacy first principle is always respected. ELRP should
17 only be eligible for dispatch after, or potentially simultaneously with, other resource
18 adequacy demand response programs. For example, if the ELRP can be notified day-
19 ahead for load reduction the following operating day, then similarly, resource adequacy
20 demand response programs like BIP and AP-I should be eligible for a day-ahead
21 commitment to ensure resource adequacy resources, which have been paid for, are used
22 and useful before relying on a voluntary program like ELRP. ELRP is insurance in case
23 resource adequacy resources are insufficient to meet the system’s reliability needs.

24
25 **Q7. SCE states “The IOUs’ DR Load Impact Reports are used to determine a DR**
26 **program’s resource adequacy allocation for each month. DR Load Impact Reports**
27 **use a regression analysis to determine a program’s average load impacts, whereas**
28 **CAISO settlements use a baseline calculation, such as a 10-in-10 or 5-in-10 baseline.**
29 **These different methods will cause a difference in results.” SCE claims the CAISO**
30 **baseline is “biased because it relies on prior days’ data where there were no**
31 **dispatches and the temperatures were lower.” Please explain why the CAISO uses a**
32 **baseline calculation approach to calculate demand response resource performance.**

A7. SCE’s reference to the Load Impact Reports—which the Commission uses for planning purposes and to set qualifying capacity values for demand response programs—is not the appropriate metric to gauge actual demand response resource performance to a dispatch instruction. Instead, demand response performance should be measured against the appropriate baseline selected by the demand response provider. The CAISO adopted the customer baseline load methodologies for operational and settlement purposes through an open and transparent stakeholder process, including conducting a “California ISO Baseline Accuracy Assessment” performed by Nexant. As part of that process, the CAISO worked with stakeholders, including demand response providers and the investor owned utilities, to establish the most accurate and consensus-based customer baseline load options to assess demand response resource performance.²

Pursuant to that process, the CAISO sought, and FERC approved, several baseline options for demand response resources. The CAISO offers demand response providers a broad array of FERC-approved baselines with appropriate day-of adjustment caps. These approved baselines represent the appropriate metric to assess demand response resource performance on a resource specific and event-by-event basis. Investor owned utilities, likewise, apply “energy baselines” that assess event-day performance, and include non-event days to capture the customer’s typical use energy profile, and they also employ day-of adjustment factors in their baseline calculations.³

² Baseline assessments were done through the baseline accuracy working group (BAWG), which was part of the CAISO’s Energy Storage and Distributed Energy Resources Phase 2 initiative. More information on this initiative can be found here: <https://stakeholdercenter.caiso.com/StakeholderInitiatives/Energy-storage-and-distributed-energy-resources#phase2>

**REPLY TESTIMONY OF DR. KARL MEEUSEN
ON BEHALF OF
THE CALIFORNIA INDEPENDENT SYSTEM OPERATOR CORPORATION
R.20-11-003**

1 SCE states that the CAISO's day-of adjustment factor is 20%.⁴ That is correct when a
2 demand response provider elects a 10-in-10 day matching baseline for non-residential
3 customers. However, the CAISO offers demand response providers broad flexibility to
4 elect the best and most suitable baseline for their customer type and situation. For
5 example, the CAISO offers a weather-matching baseline for residential and non-
6 residential customers that is best suited to weather/temperature sensitive loads, and it
7 employs a +/- 40% day-of adjustment factor,⁵ similar to SCE's day-of adjustment factor
8 for its capacity bidding program.⁶ The CAISO offers demand response baselines with
9 appropriate day-of adjustment caps as outlined in its tariff section 4.13.4, Performance
10 Evaluation Methodologies for PDRs and RDRRs.⁷

11 **V. CONCLUSION**

12 **Q8. Please summarize your recommendations.**

13 **A8.** The Commission should increase the planning reserve margin as recommended in the
14 CAISO's direct testimony. The increased planning reserve margin will provide the
15 CAISO the opportunity to use its monthly CPM authority to address a deficiency in load
16 serving entities' resource adequacy showings. The CAISO's Significant Event CPM
17 authority is limited by the its tariff and should not substitute for properly established
18 planning reserve margin levels and resource adequacy procurement obligations.

19
20 If the Commission implements an ELRP, it should also adopt protections to avoid dual
21 participation and to ensure that resource adequacy demand responses are dispatched prior
22 to, or simultaneously with, ELRP resources.

23
24 **Q9. Does this conclude your testimony?**

25 **A9.** Yes, it does.
