

# **Market Performance Report December 2017**

February 7, 2018

ISO Market Quality and Renewable Integration

---

CAISO  
250 Outcropping Way  
Folsom, California 95630  
(916) 351-4400

## Executive Summary<sup>1</sup>

The market performance in December 2017 is summarized below.

CAISO area performance,

- Peak loads for ISO stayed low in December due to cold weather.
- In the integrated forward market (IFM), SCE and SDG&E prices were elevated in more than ten days due to transmission congestion. In the fifteen-minute market (FMM) and real-time market (RTD), SCE and SDG&E prices were elevated in a couple of days due to transmission congestion.
- Congestion rents for interties dropped to \$1.68 million from \$6.00 million in November. Majority of the congestion rents in December accrued on Palo Verde (49 percent) intertie and NOB (26 percent) intertie.
- In the congestion revenue rights (CRR) market, revenue adequacy was 76.32 percent, decreasing slightly from 76.79 percent in November. The nomogram OMS 4646120 ELD\_MKP\_SCIT\_NG contributed largely to the revenue shortfall.
- The monthly average ancillary service cost to load fell to \$0.35/MWh from \$0.42/MWh in November. There were two regulation up scarcity events on December 14 in the SP26 expanded region driven by generation outage.
- The cleared virtual supply was well above the cleared demand in most days of December. The profits from convergence bidding decreased to \$1.61 million from \$2.42 million in November.
- The bid cost recovery rose to \$9.43 million from \$5.94 million in November.
- The real-time energy offset inched up to \$2.00 million from \$1.74 million in November. The real-time congestion offset cost declined to \$4.42 million from \$4.99 million in November.
- The volume of exceptional dispatch rose to 95,166 MWh from 67,953 MWh in November. The main contributor to this volume was conditions beyond the control of the CAISO, which was driven by fire. The monthly average of total exceptional dispatch volume as a percentage of load percentage rose to 0.52 percent from 0.40 percent in November.

---

<sup>1</sup> This report contains the highlights of the reporting period. For a more detailed explanation of the technical characteristics of the metrics included in this report please download the Market Performance Metric Catalog, which is available on the CAISO web site at <http://www.caiso.com/market/Pages/ReportsBulletins/Default.aspx>.

Energy Imbalance market (EIM) performance,

- In the FMM and RTD, the prices for NEVP were elevated on December 10 due to limited imports and tight supply.
- The monthly average prices in FMM for EIM entities (PACE, PACW, NEVP, AZPS, PSEI, and PGE) were \$26.02, \$26.20, \$35.29, \$31.44, \$26.47 and \$25.91 respectively.
- The monthly average prices in RTD for EIM entities (PACE, PACW, NEVP, AZPS, PSEI, and PGE) were \$25.65, \$25.09, \$33.51, \$28.62, \$26.25 and \$24.89 respectively.
- Bid cost recovery, real-time imbalance energy offset, and real-time congestion offset costs for EIM entities (PACE, PACW, NEVP, AZPS, PSEI, and PGE) were \$1.32 million, \$0.90 million and \$0.06 million respectively.

## Market Characteristics

### Loads

Peak loads for ISO stayed low in December due to cold weather. During December, the load peaks dropped from 31,000 to about 26,500 MW.

**Figure 1: System Peak Load**

## Resource Adequacy Available Incentive Mechanism

Resource Adequacy Availability Incentive Mechanism (RAAIM) was activated on November 1, 2016 to track the performance of Resource Adequacy (RA) Resources. RAAIM is used to determine the availability of resources providing local and/or system Resource Adequacy Capacity and Flexible RA Capacity each month and then assess the resultant Availability Incentive Payments and Non-Availability Charges through the CAISO’s settlements process. Table 1 below shows the monthly average actual availability, total non-availability charge, and total availability incentive payment.<sup>2</sup>

**Table 1: Resource Adequacy Availability and Payment**

	Average Actual Availability	Total Non-availability Charge	Total Availability Incentive Payment
<b>Nov-16</b>	92.23%	\$3,616,895	-\$1,678,657
<b>Dec-16</b>	96.25%	\$1,878,503	-\$1,878,503
<b>Jan-17</b>	26.30%	\$49,188,214	-\$5,670
<b>Feb-17</b>	92.31%	\$3,157,590	-\$1,867,721
<b>Mar-17</b>	91.92%	\$2,975,585	-\$1,550,365
<b>Apr-17</b>	89.43%	\$4,096,806	-\$1,543,647
<b>May-17</b>	95.97%	\$1,812,398	-\$1,429,830
<b>Jun-17</b>	95.13%	\$2,426,279	-\$1,422,549
<b>Jul-17</b>	96.11%	\$1,298,826	-\$1,298,826
<b>Aug-17</b>	64.11%	\$29,701,024	-\$19,051
<b>Sep-17</b>	96.52%	\$1,055,396	-\$1,055,396
<b>Oct-17</b>	97.42%	\$690,037	-\$690,037
<b>Nov-17</b>	96.15%	\$1,483,755	-\$1,483,755
<b>Dec-17</b>	96.57%	\$1,678,959	-\$1,678,959

<sup>2</sup> On June 21, 2017, the ISO indicated in the market notice that it intended to file a petition with the FERC for a limited tariff waiver on section 40.9.6 to forego assessing any Resource Adequacy Availability Incentive Mechanism (RAAIM) charges for the period April 1, 2017 through December 31, 2017 due to identified implementation issues. This waiver includes April, 2017 and May 2017. The ISO is currently estimating the penalties reflected in the charge code 8830 to be zero pursuant to tariff section 11.29.10.5.

## Direct Market Performance Metrics

### Energy

#### Day-Ahead Prices

Figure 2 shows daily prices of four default load aggregate points (DLAPs). Table 2 below lists the binding constraints along with the associated DLAP locations and the occurrence dates when the binding constraints resulted in relatively high or low DLAP prices.

**Figure 2: Day-Ahead Simple Average LAP Prices (All Hours)**

**Table 2: Day-Ahead Transmission Constraints**

DLAP	Date	Transmission Constraint
SCE, SDG&E	December 1, 4-8, 11-14, 18-22, 26-29	OMS 4646120 ELD_MKP_SCIT_NG, OMS 4646112_OP-6610, SERRANO-SERRANO-500 XFMR

### Real-Time Prices

FMM daily prices of the four DLAPs are shown in Figure 3. Table 3 lists the binding constraints along with the associated DLAP locations and the occurrence dates when the binding constraints resulted in relatively high or low DLAP prices.

**Figure 3: FMM Simple Average LAP Prices (All Hours)**

**Table 3: FMM Transmission Constraints**

DLAP	Date	Transmission Constraint
SDG&E	December 1	PENSQTOS-_MIRAMRT-69.kV line, SYCAMORE-CHCARITA-138kV line
SDG&E	December 6-8	7820_TL23040_IV_SPS_NG
SCE, SDG&E	December 12-14, 18-20	OMS 4646120 ELD_MKP_SCIT_NG, SERRANO -SERRANO -500 XFMR
SDG&E	December 27	OMS 5489791 TL23055_NG

Figure 4 below shows the daily frequency of positive price spikes and negative prices by price range for the default LAPs in the FMM. The cumulative frequency of prices above \$250/MWh declined to 0.10 percent in December from 0.47 percent in November. The cumulative frequency of negative prices decreased to 0.03 percent in December from 1.08 percent in November.

**Figure 4: Daily Frequency of FMM LAP Positive Price Spikes and Negative Prices**

RTD daily prices of the four DLAPs are shown in Figure 5.

**Table 4** lists the binding constraints along with the associated DLAP locations and the occurrence dates when the binding constraints resulted in relatively high or low DLAP prices.

**Figure 5: RTD Simple Average LAP Prices (All Hours)**

**Table 4: RTD Transmission Constraints**

DLAP	Date	Transmission Constraint
SCE, SDG&E	December 1	PENSQTOS-_MIRAMRT-69.kV line, SYCAMORE-CHCARITA-138kV line, OMS 4646120 ELD_MKP_SCIT_NG
SDG&E	December 6-8	7820_TL23040_IV_SPS_NG
SCE, SDG&E	December 11-13, 18-23	OMS 4646120 ELD_MKP_SCIT_NG, SERRANO -SERRANO -500 XFMR
SDG&E	December 27	OMS 5489791 TL23055_NG

Figure 6 below shows the daily frequency of positive price spikes and negative prices by price range for the default LAPs in RTD. The cumulative frequency of prices above \$250/MWh decreased to 0.52 percent in December from 0.70 percent in November. The cumulative frequency of negative prices fell to 0.61 percent in December from 1.95 percent in November.

**Figure 6: Daily Frequency of RTD LAP Positive Price Spikes and Negative Price**

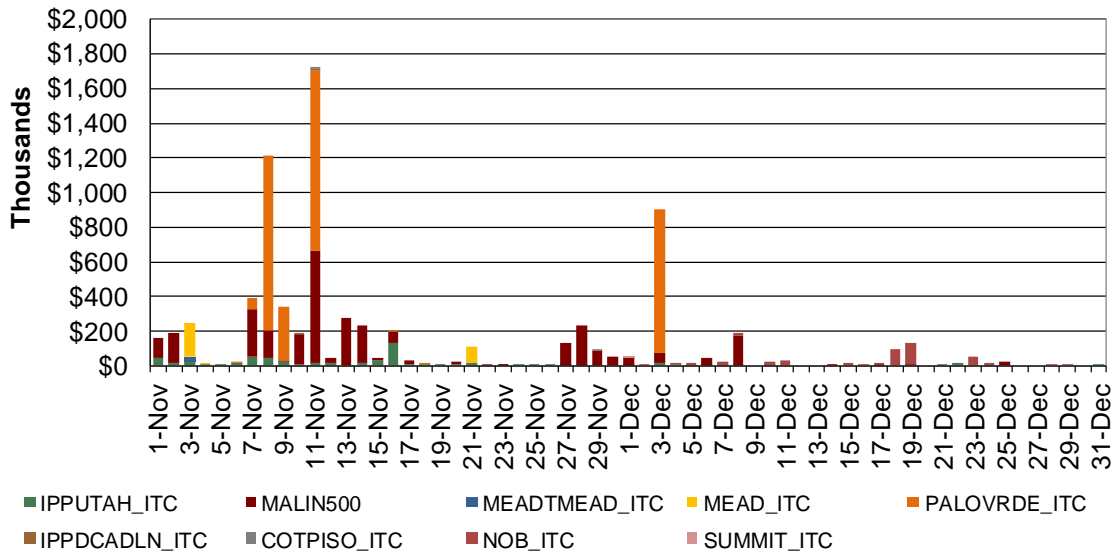

## Congestion

### Congestion Rents on Interties

Figure 7 below illustrates the daily integrated forward market congestion rents by interties. The cumulative total congestion rent for interties in December dropped to \$1.68 million from \$6.00 million in November. Majority of the congestion rents in December accrued on Palo Verde (49 percent) intertie and NOB (26 percent) intertie.

The congestion rent on NOB increased to \$0.44 million in December from \$7,789 in November. The congestion rent on Palo Verde decreased to \$0.83 million in December from \$2.45 million in November.

**Figure 7: IFM Congestion Rents by Interties (Import)**

### Average Congestion Cost per Load Served

This metric quantifies the average congestion cost for serving one megawatt of load in the ISO system. Figure 8 shows the daily and monthly averages for the day-ahead and real-time markets respectively.

**Figure 8: Average Congestion Cost per Megawatt of Served Load**

The average congestion cost per MWh of load served in the integrated forward market inched up to \$3.55/MWh in December from \$2.70/MWh in November. The average congestion cost per load served in the real-time market increased to -\$0.25/MWh in December from -\$0.29/MWh in November.

### Congestion Revenue Rights

Figure 9 illustrates the daily revenue adequacy for congestion revenue rights (CRRs) broken out by transmission element. The average CRR revenue deficit in December increased to \$626,046 from the average revenue deficit of \$459,465 in November.

**Figure 9: Daily Revenue Adequacy of Congestion Revenue Rights**

Overall, December experienced a CRR revenue deficit. Revenue shortfalls were observed throughout December. The main reasons are shown below.

- The nomogram OMS 4646120 ELD\_MKP\_SCIT\_NG was binding in 28 days of this month, resulting in revenue shortfall of \$10.43 million. This nomogram was enforced for the outage of El dorado-Moenkopi 500 kV line.
- The transformer 24138\_SERRANO\_500\_24137\_SERRANO was binding in 28 days of this month, resulting in revenue shortfall of \$7.69 million. The congestion was driven by the outage of bank #3.

The shares of the revenue surplus and deficit accruing on various congested transmission elements for the reporting period are shown in Figure 10 and the monthly summary for CRR revenue adequacy is provided in Table 5.

**Figure 10: CRR Revenue Adequacy by Transmission Element**

Overall, the total amount collected from the IFM was not sufficient to cover the net payments to congestion revenue right holders and the cost of the exemption for existing rights. The revenue adequacy level was 76.32 percent in December. Out of the total congestion rents, 4.51 percent was used to cover the cost of existing right exemptions. Net total congestion revenues in December were in deficit by \$19.41 million, compared to the deficit of \$13.78 million in November. The auction revenues credited to the balancing account for December were \$7.20 million. As a result, the balancing account for December had a deficit of approximately \$12.20 million, which will be allocated to measured demand.

**Table 5: CRR Revenue Adequacy Statistics**

IFM Congestion Rents	\$65,512,162.18
Existing Right Exemptions	-\$2,952,633.07
Available Congestion Revenues	\$62,559,529.10
CRR Payments	\$81,966,954.97
CRR Revenue Adequacy	-\$19,407,425.87
Revenue Adequacy Ratio	76.32%
Annual Auction Revenues	\$3,106,581.60
Monthly Auction Revenues	\$4,095,649.74
CRR Settlement Rule	\$9,314.23
Allocation to Measured Demand	-\$12,195,880.30

## Ancillary Services

### IFM (Day-Ahead) Average Price

Table 6 shows the monthly IFM average ancillary service procurements and the monthly average prices. In December the monthly average procurement increased for all four types of ancillary services.

**Table 6: IFM (Day-Ahead) Monthly Average Ancillary Service Procurement**

	Average Procured				Average Price			
	Reg Up	Reg Dn	Spinning	Non-Spinning	Reg Up	Reg Dn	Spinning	Non-Spinning
<b>Dec-17</b>	329	392	729	730	\$7.68	\$8.01	\$2.99	\$0.10
<b>Nov-17</b>	315	383	716	716	\$8.02	\$6.61	\$5.14	\$0.47
<b>Percent Change</b>	4.60%	2.35%	1.91%	1.91%	-4.24%	21.15%	-41.80%	-78.43%

The monthly average prices increased for regulation down in December. Figure 11 shows the daily IFM average ancillary service prices. The average price for regulation down was relatively high on December 3 due to high opportunity cost of energy.

**Figure 11: IFM (Day-Ahead) Ancillary Service Average Price**

### Ancillary Service Cost to Load

The monthly average cost to load fell to \$0.35/MWh in December from \$0.42/MWh in November.

**Figure 12: System (Day-Ahead and Real-Time) Average Cost to Load**

### Scarcity Events

The ancillary services scarcity pricing mechanism is triggered when the ISO is not able to procure the target quantity of one or more ancillary services in the IFM and real-time market runs. On December 14, 2017, a regulation up scarcity occurred in the 15-minute market run in the SP26 expanded region for hour ending 8 intervals 1 and 2. The procurement shortfall was 10 MW or 10% of the target procurement quantity in interval 1 and 5 MW or 5% of the target procurement quantity in interval 2.

## Convergence Bidding

Figure 13 below shows the daily average volume of cleared virtual bids in IFM for virtual supply and virtual demand. The cleared virtual supply was well above the cleared demand in most days of December.

**Figure 13: Cleared Virtual Bids**

Convergence bidding tends to cause the day-ahead market and real-time market prices to move closer together, or “converge”. Figure 14 shows the energy prices (namely the energy component of the LMP) in IFM, hour ahead scheduling process (HASP), FMM, and RTD.

**Figure 14: IFM, HASP, FMM, and RTD Prices**

Figure 15 shows the profits that convergence bidders receive from convergence bidding. The total profits from convergence bidding decreased to \$1.61 million in December from \$2.42 million in November.

**Figure 15: Convergence Bidding Profits**

### Renewable Generation Curtailment

Figure 16 below shows the monthly wind and solar VERs (variable energy resource) curtailment due to system wide condition or local congestion in RTD. Figure 17 shows the monthly wind and solar VERs (variable energy resource) curtailment by resource type in RTD. Economic curtailment is defined as the resource’s dispatch upper limit minus its RTD schedule when the resource has an economic bid. Dispatch upper limit is the maximum level the resource can be dispatched to when various factors are take into account such as forecast, maximum economic bid, generation outage, and ramping capacity. Self-schedule curtailment is defined as the resource’s self-schedule minus its RTD schedule when RTD schedule is lower than self-schedule. When a VER resource is exceptionally dispatched, then exceptional dispatch curtailment is defined as the dispatch upper limit minus the exceptional dispatch value.

As Figure 16 and Figure 17 below indicate, the renewable curtailment remained low in December. The majority of the curtailments was economic.

**Figure 16: Renewable Curtailment by Reason**

**Figure 17: Renewable Curtailment by Resource Type**

### Flexible Ramping Product

On November 1, 2016 the ISO implemented two market products in the 15-minute and 5-minute markets: Flexible Ramping Up and Flexible Ramping Down uncertainty awards. These products provide additional upward and downward flexible ramping capability to account for uncertainty due to demand and renewable forecasting errors. In addition, the existing flexible ramping sufficiency test was extended to ensure feasible ramping capacity for real-time interchange schedules.

### Flexible Ramping Product Payment

Figure 18 shows the flexible ramping up and down uncertainty payments. Flexible ramping up uncertainty payment inched down to \$0.31 million in December from \$0.37 million in November. Flexible ramping down uncertainty payment decreased to -\$2,314 in December from -\$18 in November.

**Figure 18: Flexible Ramping Up/down Uncertainty Payment**

Figure 19 shows the flexible ramping forecast payment. Flexible ramping forecast payment rose to \$33,956 this month from -\$5,357 in November.

**Figure 19: Flexible Ramping Forecast Payment**

## Indirect Market Performance Metrics

### Bid Cost Recovery

Figure 20 shows the daily uplift costs due to exceptional dispatch payments. The monthly uplift costs in December increased to \$3.30 million from \$0.35 million in November. Most of the uplift costs occurred on December 5-12 due to the exceptional dispatches issued for the reason “conditions beyond the control of the CAISO”, which was mainly driven by fire.

**Figure 20: Exceptional Dispatch Uplift Costs**

Figure 21 shows the allocation of bid cost recovery payment in the IFM, residual unit commitment (RUC) and RTM markets. The total bid cost recovery for December rose to \$9.43 million from \$5.94 million in November. Out of the total monthly bid cost recovery payment for the three markets in December, the IFM market contributed 19 percent, RTM contributed 66 percent, and RUC contributed 15 percent of the total bid cost recovery payment.

**Figure 21: Bid Cost Recovery Allocation**

Figure 22 and Figure 23 show the daily and monthly BCR cost by local capacity requirement area (LCR) respectively.

**Figure 22: Bid Cost Recovery Allocation by LCR**

**Figure 23: Monthly Bid Cost Recovery Allocation by LCR**

Figure 24 and Figure 25 show the daily and monthly BCR cost by utility distribution company (UDC) respectively.

**Figure 24: Bid Cost Recovery Allocation by UDC**

**Figure 25: Monthly Bid Cost Recovery Allocation by UDC**

Figure 26 shows the cost related to BCR by cost type in RUC.

**Figure 26: Cost in RUC**

Figure 27 and Figure 28 show the daily and monthly cost related to BCR by type and LCR in RUC respectively.

**Figure 27: Cost in RUC by LCR**

**Figure 28: Monthly Cost in RUC by LCR**

Figure 29 and Figure 30 show the daily and monthly cost related to BCR by type and UDC in RUC respectively.

**Figure 29: Cost in RUC by UDC**

**Figure 30: Monthly Cost in RUC by UDC**

Figure 31 shows the cost related to BCR in real time by cost type. Minimum load cost and energy cost contributed mostly to the real time cost this month.

**Figure 31: Cost in Real Time**

Figure 32 and Figure 33 show the daily and monthly cost related to BCR by type and LCR in real time respectively.

**Figure 32: Cost in Real Time by LCR**

**Figure 33: Monthly Cost in Real Time by LCR**

Figure 34 and Figure 35 show the daily and monthly cost related to BCR by type and UDC in Real Time respectively.

**Figure 34: Cost in Real Time by UDC**

**Figure 35: Monthly Cost in Real Time by UDC**

Figure 36 shows the cost related to BCR in IFM by cost type. Minimum Load cost and energy cost contributed largely to the cost in IFM this month.

**Figure 36: Cost in IFM**

Figure 37 and Figure 38 show the daily and monthly cost related to BCR by type and location in IFM respectively.

**Figure 37: Cost in IFM by LCR**

**Figure 38: Monthly Cost in IFM by LCR**

Figure 39 and Figure 40 show the daily and monthly cost related to BCR by type and UDC in IFM respectively.

**Figure 39: Cost in IFM by UDC**

**Figure 40: Monthly Cost in IFM by UDC**

### Real-time Imbalance Offset Costs

Figure 41 shows the daily real-time energy and congestion imbalance offset costs. Real-time energy offset cost edged up to \$2.00 million in December from \$1.74 million in November. Real-time congestion offset cost declined to \$4.42 million in December from \$4.99 million in November.

**Figure 41: Real-Time Energy and Congestion Imbalance Offset**

## Market Software Metrics

Market performance can be confounded by software issues, which vary in severity levels with the failure of a market run being the most severe.

## Market Disruption

A market disruption is an action or event that causes a failure of an ISO market, related to system operation issues or system emergencies.<sup>3</sup> Pursuant to section 7.7.15 of the ISO tariff, the ISO can take one or more of a number of specified actions to prevent a market disruption, or to minimize the extent of a market disruption.

There were a total of 57 market disruptions in September. Table 7 lists the number of market disruptions and the number of times that the ISO removed bids (including self-schedules) in any of the following markets in this month. The ISO markets include IFM, RUC, FMM and RTD processes.

**Table 7: Summary of Market Disruption**

Type of CAISO Market	Market Disruption or Reportable	Removal of Bids (including Self-Schedules)
<b>Day-Ahead</b>		
IFM	0	0
RUC	0	0
<b>Real-Time</b>		
FMM Interval 1	7	0
FMM Interval 2	5	0
FMM Interval 3	0	0
FMM Interval 4	5	0
Real-Time Dispatch	40	0

Figure 42 shows the frequency of IFM, HASP (FMM interval 2), FMM (intervals 1, 3 and 4), and RTD failures. On December 6, one HASP, two FMM and 7 RTD disruptions occurred due to application problem. There was one other RTD disruption that day due to broadcast not being successful.

<sup>3</sup> These system operation issues or system emergencies are referred to in Sections 7.6 and 7.7, respectively, of the ISO tariff.

**Figure 42: Frequency of Market Disruption**

## Manual Market Adjustment

### Exceptional Dispatch

Figure 43 shows the daily volume of exceptional dispatches, broken out by market type: real-time incremental dispatch and real-time decremental dispatch. The real-time exceptional dispatches are among one of the following types: a unit commitment at physical minimum; an incremental dispatch above the day-ahead schedule and a decremental dispatch below the day-ahead schedule.

The total volume of exceptional dispatch in December increased to 95,166 MWh from 67,953 MWh in November.

**Figure 43: Total Exceptional Dispatch Volume (MWh) by Market Type**

Figure 44 shows the volume of the exceptional dispatch broken out by reason.<sup>4</sup> The majority of the exceptional dispatch volumes in December were driven by load forecast uncertainty (13 percent), planned transmission (15 percent), and conditions beyond the control of the CAISO (59 percent).

<sup>4</sup> For details regarding the reasons for exceptional dispatch please read the white paper at this link: <http://www.caiso.com/1c89/1c89d76950e00.html>.

**Figure 44: Total Exceptional Dispatch Volume (MWh) by Reason**

Figure 45 shows the total exceptional dispatch volume as a percent of load, along with the monthly average. The monthly average percentage rose to 0.52 percent in December from 0.40 percent in November.

**Figure 45: Total Exceptional Dispatch as Percent of Load**

## Energy Imbalance Market

On November 1, 2014, the California Independent System Operator Corporation (ISO) and Portland-based PacifiCorp fully activated the Energy Imbalance Market (EIM). This real-time market is the first of its kind in the West. EIM covers six western states: California, Oregon, Washington, Utah, Idaho and Wyoming.

On December 1, 2015, NV Energy, the Nevada-based utility successfully began participating in the western Energy Imbalance Market (EIM). On October 1, 2016, Phoenix-based Arizona Public Service (AZPS) and Puget Sound Energy (PSEI) of Washington State successfully began full participation in the western Energy Imbalance Market.

On October 1, 2017, Portland General Electric Company (PGE) became the fifth western utility to successfully begin full participation in the western Energy Imbalance Market (EIM). PGE joins Arizona Public Service, Puget Sound Energy, NV Energy, PacifiCorp and the ISO, together serving over 38 million consumers in eight states: California, Arizona, Oregon, Washington, Utah, Idaho, Wyoming and Nevada.

Figure 46 shows daily simple average ELAP prices for PacifiCorp east (PACE), PacifiCorp West (PACW), NV Energy (NEVP), Arizona Public Service (AZPS), Puget Sound Energy (PSEI), and Portland General Electric Company (PGE) for all hours in FMM. The price for NEVP was elevated on December 10 due to limited imports and tight supply.

**Figure 46: EIM Simple Average LAP Prices (All Hours) in FMM**

Figure 47 shows daily simple average ELAP prices for PACE, PACW, NEVP, AZPS, PSEI, and PGE for all hours in RTD. The price for NEVP was elevated on December 10 driven by limited imports and tight supply.

**Figure 47: EIM Simple Average LAP Prices (All Hours) in RTD**

Figure 48 shows the daily price frequency for prices above \$250/MWh and negative prices in FMM for PACE, PACW, NEVP, AZPS, PSEI, and PGE. The cumulative frequency of prices above \$250/MWh edged down to 0.31 percent in December from 0.35 percent in November. The cumulative frequency of negative prices decreased to 0.30 percent in December from 1.15 percent in November.

**Figure 48: Daily Frequency of EIM LAP Positive Price Spikes and Negative Prices in FMM**

Figure 49 shows the daily price frequency for prices above \$250/MWh and negative prices in RTD for PACE, PACW, NEVP, AZPS, PSEI, and PGE. The cumulative frequency of prices above \$250/MWh decreased to 0.28 percent in December from 0.31 percent in November. The cumulative frequency of negative prices fell to 0.59 percent in December from 1.71 percent in November.

**Figure 49: Daily Frequency of EIM LAP Positive Price Spikes and Negative Prices in RTD**

Figure 50 shows the daily volume of EIM transfer for CAISO in FMM. “Import” represents the total EIM transfer from other balancing areas (BAs) into CAISO. “Export” represents the total EIM transfer out of CAISO to other BAs in FMM.

**Figure 50: EIM Transfer for CAISO in FMM**

Figure 51 shows the daily volume of EIM transfer for PACE in FMM. Figure 52 shows the daily volume of EIM transfer for PACW in FMM.

**Figure 51: EIM Transfer for PACE in FMM**

**Figure 52: EIM Transfer for PACW in FMM**

Figure 53 shows the daily volume of EIM transfer for NEVP in FMM.

**Figure 53: EIM Transfer for NEVP in FMM**

Figure 58 shows the daily volume of EIM transfer for PACE in RTD. Figure 59 shows the daily EIM transfer volume for PACW in RTD.

**Figure 58: EIM Transfer for PACE in RTD**

**Figure 59: EIM Transfer for PACW in RTD**

Figure 60 shows the daily EIM transfer volume for NEVP in RTD.

**Figure 60: EIM Transfer for NEVP in RTD**

Figure 61 shows the daily volume EIM transfer for AZPS in RTD.

**Figure 61: EIM Transfer for AZPS in RTD**

Figure 62 shows the daily volume EIM transfer for PSEI in RTD.

**Figure 62: EIM Transfer for PSEI in RTD**

Figure 63 shows the daily volume EIM transfer for PGE in RTD.

**Figure 63: EIM Transfer for PGE in RTD**

Figure 64 shows daily real-time imbalance energy offset cost (RTIEO) for PACE, PACW, NEVP, AZPS, PSEI, and PGE respectively. Total RTIEO was \$0.90 million in December, decreasing from 1.55 million in November.

**Figure 64: EIM Real-Time Imbalance Energy Offset by Area**

Figure 65 shows daily real-time congestion offset cost (RTCO) for PACE, PACW, NEVP, AZPS, PSEI, and PGE respectively. Total RTCO skidded to \$0.06 million in December from \$0.64 million in November.

**Figure 65: EIM Real-Time Congestion Imbalance Offset by Area**

Figure 66 shows daily bid cost recovery for PACE, PACW, NEVP, AZPS, PSEI, and PGE respectively. Total BCR increased to \$1.32 million in December from \$1.16 million in November.

**Figure 66: EIM Bid Cost Recovery by Area**

Figure 67 shows the flexible ramping up uncertainty payment for PACE, PACW, NEVP, AZPS, PSEI, and PGE respectively. Total flexible ramping up uncertainty payment in December dropped to \$0.30 million from \$0.37 million in November.

**Figure 67: Flexible Ramping Up Uncertainty Payment**

Figure 68 shows the flexible ramping down uncertainty payment for PACE, PACW, NEVP, AZPS, PSEI, and PGE respectively. Total flexible ramping down uncertainty payment in December decreased to \$1,814 from \$3,434 million in November.

**Figure 68: Flexible Ramping Down Uncertainty Payment**

Figure 69 shows the flexible ramping forecast payment for PACE, PACW, NEVP, AZPS, PSEI, and PGE respectively. Total forecast payment in December declined to \$0.10 million from \$0.30 million in November.

**Figure 69: Flexible Ramping Forecast Payment**

The ISO’s Energy Imbalance Market Business Practice Manual<sup>5</sup> describes the methodology for determining whether an EIM participating resource is dispatched to support transfers to serve California load. The methodology ensures that the dispatch considers the combined energy and associated marginal greenhouse gas (GHG) compliance cost based on submitted bids<sup>6</sup>.

In the first two months of EIM operations (November and December 2014), EIM startup issues related to processing GHG bid adder resulted in the dispatch of coal generation to support transfers into California. Once the adders were properly accounted for, beginning in January 2015, almost all of the EIM dispatches to support transfers into the ISO were from resources other than coal, as documented in Figure 70 and Table 8 below.

**Figure 70: Percentage of EIM Transfer into ISO by Fuel Type**

<sup>5</sup> See the Energy Imbalance Market Business Practice Manual for a description of the methodology for making this determination, which begins on page 42 -- [http://bpmcm.caiso.com/Pages/BPMDetails.aspx?BPM=Energy Imbalance Market](http://bpmcm.caiso.com/Pages/BPMDetails.aspx?BPM=Energy%20Imbalance%20Market).

<sup>6</sup> A submitted bid may reflect that a resource is not available to support EIM transfers to California.

**Table 8: EIM Transfer into ISO by Fuel Type**

Month	Coal (%)	Gas (%)	Non-Emitting (%)	Total
Nov-14	3.66%	11.12%	85.22%	100%
