Purpose
Provide guidelines on reviewing planned outages and RC Operational Planning Analysis (OPA) results for the next day; and communicating and coordinating any changes with BAs, TOPs and neighboring RCs to ensure that planned operations for the next day will respect SOLs and IROLs.

1. Responsibilities
- Reliability Coordinator Operator
- Transmission Operator
- Balancing Authority

2. Scope/Applicability
- This procedure addresses the outage review and coordination process performed by the RC Operator after the completion of the CAISO RC OPA process\(^1\), in preparation for next-day operations. The outage coordination process for the Operations Planning time Horizon in accordance with relevant requirements in NERC IRO-017 is addressed in *CAISO RC Outage Coordination Process*.

3. Procedure Detail

3.1. Planned Transmission and Generation Outage Review

Each night, in collaboration with each BA and TOP in the RC Area, the RC operator will verify that outages listed in the Outage Management System [OMS]\(^2\) for the next day represent the work that is *actually* planned. This includes BAs and TOPs that do not have outages in OMS, to ensure that there are no urgent or forced outages that have been overlooked for the next day. For BAs and TOPs that delegate these responsibilities, a verification by the delegate is sufficient.

Next-day outage verification is critical to ensure that any unanticipated changes to planned outages, the status of BES facilities, RAS’s, and non-BES facilities that impact the BES are accounted for in the RC OPA for the next day, and planned operations respect SOLs or IROLs\(^3\). This verification may be completed electronically without a phone call between the RC operator and each entity.

---

\(^1\) The CAISO RC OPA process is described in CAISO RC0620-Operations Planning Analysis (Next Day)
\(^2\) CAISO Outage Management System (webOMS)
\(^3\) IRO-008-2 R1, R2
Balancing Authority (for Generation Outages) or Transmission Operator (for Transmission Outages) Actions

- **Identify** outages planned for the next day (D+1). As specified in CAISO document RC0630 - Outage Coordination Process, the following types of outages, 30 minutes or more in duration, that meet any of the following criteria are expected to be in CAISO OMS:
  - BES transmission and/or generation facilities outages as defined by NERC,
  - BES generation derates of an individual unit or aggregate plant capacity by greater than 50 MW,
  - BES/non-BES necessary for voltage control,
  - BES Remedial Action Scheme (RAS), non-RAS automatic schemes, or protection systems when functionality is affected (i.e., when normal fault clearing zones are impacted) or Contingency definitions are impacted,
  - BES generating unit Automatic Voltage Regulators (AVR), BES Power System Stabilizers (PSS) or BES alternative voltage controlling devices,
  - Non-BES transmission or generation Facilities or equipment that are identified by the RC, TOP or BA as having an impact on the reliability of the BES, and
  - Path or Facility TTC limits if part of an operating plan
  - Telemetering Equipment that requires manual EMS or RTCA adjustment or communication channels impacting system protection that result in EMS alarms.

- **Verify** that outages listed in CAISO OMS represent work that is actually planned for the next day.
  - This may be done either by logging into the CAISO OMS web user interface or reviewing an exported outage list sent by the RC operator.
  - **Note:** This check is critical especially when an entity manages outages using a different outage management application. Sometimes, due to application issues, certain outages sent to OMS via a web service or Application Programming Interface (API) may not be properly registered in OMS. To ensure the list of outages in OMS represents what is actually planned, this verification must be completed.

- **Verify** that the following information in CAISO OMS is correct:
  - Planned start time,
  - Planned end time,
  - Facility or equipment to be switched in or out,
  - Facility Rating Changes.

- Determine whether there are any other facilities or equipment not in OMS scheduled to be switched out or derated.
Outage Review and Coordination

Balancing Authority (for Generation Outages) or Transmission Operator (for Transmission Outages) Actions

- **Notify** the RC operator, using the Grid Messaging System (GMS), that the CAISO OMS list is accurate; or call the RC operator by phone if there are discrepancies.
  - If there are no outages planned, notify the RC operator using GMS that no outages are planned.
- **Notify** the RC operator if there are any anticipated issues due to weather, gas/fuel, capacity/reserve adequacy, etc.

Reliability Coordinator Actions

- **Retrieve** transmission and generation outages in OMS scheduled to start the next-day (D+1).
- **Identify** outages that, at a minimum, meet any of the following criteria:
  - BES transmission equipment outages, as defined by NERC, to be switched out of service,
  - BES generation outages as defined by NERC,
  - BES generation derates of an individual unit or aggregate plant capacity by greater than 50 MW,
  - BES Remedial Action Scheme (RAS), non-RAS automatic schemes, or protection systems when functionality is affected (i.e., when normal fault clearing zones are impacted) or Contingency definitions are impacted,
  - BES generating unit Automatic Voltage Regulators (AVR), BES Power System Stabilizers (PSS) or BES alternative voltage controlling devices,
  - Non-BES transmission or generation Facilities or equipment that are identified by the RC, TOP or BA as having an impact on the reliability of the BES, which will be switched out of service, and
  - Telemetering Equipment that requires manual EMS or RTCA adjustment or communication channels impacting system protection that result in EMS alarms.
- **Confirm**, in coordination with the BA and TOP, that outages listed in OMS represent work that is actually planned for the next day.
- **Verify** if there are any anticipated issues due to weather, gas/fuel, capacity/reserve adequacy, etc.
- **Resolve** and **Log** any major discrepancies discovered during the review that are deemed critical to reliability.
3.1.1. Changes to Scheduled Outages

Any BA/TOP outages for the next-day (D+1) not in OMS or any changes to start or end time for scheduled outages in OMS need to be studied to ensure there are no adverse reliability impacts.

### Reliability Coordinator Actions

- **Ensure** the BA/TOP submits *new urgent/forced outages or changes* to scheduled outages in OMS.
- **Request** a study from RCOE to ensure the changes will not adversely affect reliable operations of the grid.
- **Ensure** that an *Operating Plan, Process or Procedure* is in place for an identified *IROL* which may require actions the RC will take or direct others to take (up to and including load shedding)\(^4\), if the requested changes affect a pre-determined IROL.
- **Ensure** requested changes are *adequately coordinated* with BAs/TOPs that are impacted or potentially impacted by the requested outages.
- **Approve** the outage change request, if studies indicate that all SOLs and IROLs will be met.
- **Disapprove** the outage change request if the requested *changes will cause SOL or IROL exceedances* without sufficient mitigation, or if impacted BAs/TOPs do not approve the outage.
- **Notify** the impacted BA/TOP(s) *by phone* of the status.

### 3.2. Calls with Neighboring RCs

At the beginning of the day shift, the RC operator will have a conference call with all RCs in the Western Interconnection to discuss:

- Major Path (Stability) limitations/outages with potential wide area impacts
- New or modified IROLs
- Major transmission outages with potential wide area impacts
- Major generation outages with potential wide area impacts
- Major RAS outages with potential wide area impacts
- Facility limits changes with potential wide area impacts
- Adverse weather or system conditions
- Any other significant issues

---

\(^4\) IRO-009-2 R1
3.3. **Conduct Regional Conference Calls**

At the designated time each morning, **to ensure situational awareness of all potentially affected entities**, the RC operator will **have** a conference call with the Pacific Southwest group to discuss anticipated **significant system conditions** that impact the region. These conference calls are held at the following times:

- 0400 PPT (0500 MPT) – Pacific Southwest

### Reliability Coordinator Actions

- **Send** the *Daily RC System Report* via GMS to all BAs and TOPs in the RC Area prior to the call.
- **Send** a reminder via GMS to all parties in the **applicable** regions **30 minutes before** start of the conference call.
- **Initiate** conference call with the parties **in the region** at the scheduled time.
- **Take** a roll call.
- **Provide** a brief summary of anticipated significant system conditions with potential impact to the region:
  - Path (Stability) limitations/outages affecting the region
  - New or modified IROLs affecting the region
  - Major transmission outages with potential impacts to multiple entities in the region
  - Major generation outages with potential impacts to multiple entities in the region
  - Major RAS outages with potential impacts to multiple entities in the region
  - Facility limit changes with potential impacts to multiple entities in the region
  - Adverse weather or system conditions
  - Any other significant issues affecting the region
- **Request** BAs/TOPs to mention any changes or additions to the significant system conditions reported by the RC Operator.
- **Log** a summary of the conference call.

4. **Supporting Information**

Definitions

The following terms capitalized in this Operating Procedure are in accordance with the NERC Glossary, and/or otherwise when used are as defined below:

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remedial Action Schemes (RAS)</td>
<td>A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and MVar), tripping load, or reconfiguring a System(s). RAS accomplish objectives such as:&lt;br&gt;• Meet requirements identified in the NERC Reliability Standards,&lt;br&gt;• Maintain Bulk Electric System (BES) stability,&lt;br&gt;• Maintain acceptable BES voltages,&lt;br&gt;• Maintain acceptable BES power flows, and&lt;br&gt;• Limit the impact of Cascading or extreme events.</td>
</tr>
<tr>
<td>System Operating Limit (SOL)</td>
<td>The value (such as MW, MVar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to:&lt;br&gt;• Facility Ratings (applicable pre- and post-Contingency Equipment Ratings or Facility Ratings),&lt;br&gt;• Transient stability ratings (applicable pre- and post-Contingency stability limits),&lt;br&gt;• Voltage stability ratings (applicable pre- and post-Contingency voltage stability), and&lt;br&gt;• System voltage limits (applicable pre- and post-Contingency voltage limits).</td>
</tr>
</tbody>
</table>
