

Caiso,

Per our conversation on today's web conference, SDGE is requesting that:

1. Section 34.1.5 includes language that states that if the VER has chosen to use the CAISO forecast for its forecasting requirements, then the CAISO will populate the VER forecast for the binding interval 37.5 minutes prior to flow (the start of the market optimization for the binding interval).
2. Please add tariff language that states for a PIRP modified resource (VER internal to the CAISO), the resource's bid PMAX value will reflect the forecast for the FMM optimization run.

Thank you, Dyanne
