### **CALIFORNIA ISO STEPS UP EMERGENCY TO A STAGE TWO**

(Folsom, CA) The California Independent System Operator (California ISO) declared a Stage Two Electrical Emergency today, December 10, 2000, at 5 p.m. in effect until 10:00 p.m. The Stage Two was called after operating reserves were forecast to dip below five percent. A Stage One Emergency was issued at 11:30 a.m., in effect until 10:00 p.m. Californians are strongly encouraged to conserve electricity through the rest of the evening.

Due to cold temperatures in the Northwestern U.S. and California, electricity is in short supply. In addition, approximately 10,500 megawatts worth of in-state power generation is off line due to planned and unplanned outages, including a 1,100 megawatt unit at Diablo Canyon Nuclear Generating Station. The forecasted peak demand on the Grid is expected to reach 30, 900 megawatts at around 6:00 p.m. tonight.

The California ISO has asked for 200 megawatts of voluntary interruptible customer load shedding. **The ISO urges interruptible customers to wait to shed their contracted electrical load until specified to do so by their local utility.** Interruptible customers, mainly commercial and industrial users, receive a reduced rate in exchange for a commitment to come off line when asked to do so for reliability purposes.

-MORE-

A Stage Two Emergency is declared when operating reserves dip below five percent or are expected to within the next two hours. If an operating reserve shortfall of less than one-and-a-half percent is unavoidable, Stage Three will be initiated. Involuntary curtailments of service to customers, including “rotating blackouts,” are possible during this emergency declaration. The California ISO’s Electrical Emergency Plan (EEP) is part of the state’s enhanced reliability standards created by landmark legislation Assembly Bill 1890, which restructured California’s electricity industry.

California ISO is charged with managing the flow of electricity along the long-distance, high-voltage power lines that make up the bulk of California’s transmission system. The not-for-profit public-benefit corporation assumed the responsibility in March, 1998, when California opened its energy markets to competition and the state’s investor-owned utilities turned their private transmission power lines over to the California ISO to manage. The mission of the California ISO is to safeguard the reliable delivery of electricity, facilitate markets and ensure equal access to a 12,500 circuit mile “electron highway.”

Information about the California ISO control area’s electricity supply and the current demand is available on the web at [www.caiso.com](http://www.caiso.com).
