# 1 Introduction

## 1.1 Purpose

This document describes high level business requirements to support the Highest Emergency Rating initiative.

The project aims to primarily improve market robustness, performance, and the technology foundation for system grid reliability by updating functionality and interfaces to reduce workarounds, automating manual processes and addressing minor defects or functionality enhancements identified by the business units. This enhancement focuses specifically on internal ISO users and RC Customers having the capability to adjust the HER and ER duration in webOMS and send downstream.

## 2 Details of Business Need/Problem

### 2.1 Description

<b>Business Opportunity/Problem Statement:</b>	
<b>What:</b>	The project aims to primarily improve market robustness, performance, and the technology foundation for system grid reliability by updating functionality and interfaces to reduce workarounds, automating manual processes and addressing minor defects or functionality enhancements identified by the business units. This enhancement focuses specifically on internal ISO users and RC Customers having the capability to adjust the HER and ER duration in webOMS and send downstream.
<b>When:</b>	Refer to Release Users Group (RUG) postings for updated timelines.
<b>Why do we have this opportunity/problem:</b>	Delivering timely systems improvements that support day-to-day needs of Operations (OE), and Operations Engineering Services (OES).

## 4 Business Requirements

The sections below describe the business processes and the associated business requirements involved in the project. These may represent high-level functional, non-functional, reporting, and/or infrastructure requirements. These business requirements directly relate to the high-level scope items determined for the project.

### 4.1 Business Process: Highest Emergency Rating

#### 4.1.1 Business Requirements

:

HER – BRQ420

System (webOMS) must have three new fields on the current OMS Derate User Interface:

- “Emergency Rating Duration”
- “Highest Emergency Rating”
- “Highest Emergency Rating Duration.”

Implementation note: Duration in this instance refers to the amount of time the operator has to reduce the flow across the device to below the normal rating or the next rating. For example:

Line X-Y Rating	Rating Value	Rating Duration
Normal	200	Continuous
Emergency	250	240 min
HER	300	30 min

**Example:**

Line X-Y has a Normal Rating of 200 MW, a 4-hour Emergency Rating of 250 MW, and a 30-minute Emergency Rating of 300 MW. If flow on Line X-Y is 240 MW: - Mitigation Time = 4 hours. Flow must be reduced below 200 MW within 4 hours. If flow on Line X-Y is 280 MW: - Mitigation Time = 30 minutes. Flow must be reduced below 200 MW within 30 minutes, unless the TOP provides a less stringent Facility Ratings methodology. If flow on Line X-Y exceeds 300 MW: - Mitigation Time = None. Flow must be reduced below 200 MW immediately, unless the TOP provides a less stringent Facility Ratings methodology, which allows additional mitigation time once flows have been reduced below 300 MW.

## 4.2 Business Process: Market/Business Simulation

This section shall provide a basis for the development of the Market/Business Simulation Scenarios. These requirements will provide guidance on the market participant impacts, inputs into the Scenarios, endpoints to the Scenarios and reasons for potential Scenarios. The guidance on market participant impacts shall be gathered from the requirements that impact rules, interfaces, applications/reports, new system processes, new/modified data models, and new user roles. The source and sink systems shall be determined through the development of the system context diagram and the web service requirements. The *Reason for the Potential Scenario* column will be to offer guidance regarding what potential scenarios, and their context, may be needed for this project. This section applies to all policy development projects, market enhancements, technology enhancements, operation enhancements, Energy Imbalance Market (EIM) implementations, and Reliability Coordination (RC) service implementations. If the project team has deemed that no structured testing is needed, an end-to-end test case must be specified.

In the Reason for Potential Scenario column, select one or more of the following reasons:

1. **Rule Impacts:** Generalized changes in market rules, bidding rules, settlements rules, market design changes, or other business rules.
2. **Interface changes:** Changes that impact templates (e.g., the Resource Adequacy (RA) supply plan), user interface (UI), and application programming interface (API) (e.g., retrievals of new shadow settlement data).
3. **New application/report:** Changes that cause addition/modification of market software or reports, especially when market data input is required by the market participant.
4. **New system process:** Modification of data flow in systems, especially if the new process requires the market participant to demonstrate proficiency prior to production.
5. **New/Modified model data:** Addition or substantial modification of model data as a market solution or export provided by the ISO.
6. **New user role:** The addition or modification of access permissions for a user role applied to specific business units within an EIM entity or market participant organization (e.g., Load Serving Entity (LSE) as a Local Regulatory Authority (LRA) role). Scenarios are beneficial for market participants taking on a new function or process within their organization.
