

Stakeholder Comments Template

**Integration of Transmission Planning and Generation
Interconnection Procedures (TPP-GIP Integration)
Second Revised Straw Proposal, posted January 12, 2012**

Please submit comments (in MS Word) to TPP-GIP@caiso.com no later than the close of business on January 31, 2012.

Submitted by	Company	Date Submitted
Sandeep Arora sarora@lspower.com 925.201.5252	LS Power Development, LLC	Feb 1, 2012

This template is for submission of stakeholder comments on the topics listed below, which were discussed in the TPP-GIP Integration Second Revised Straw Proposal posted on January 12, 2012, and during the stakeholder meeting on January 19, 2012.

Please use the list of topics and questions below to structure most of your comments. At the end of the document you may offer comments on any aspect of this initiative not covered by the topics listed. When you state a preference for a particular approach on a topic or issue, your response will be most helpful if you clearly explain the reasoning and business case for your preference.

Section 1. High-level structure of the TPP-GIP Integration proposal. (Please use section 2 below to comment on the details of each element.)

1. The process as described in the January 12 paper and outlined below reflects the proposed process for projects in GIP cluster 5 and later. The process for existing queue projects (serial through cluster 4) will proceed according to the ISO's January 10, 2012 revised discussion paper.
2. After GIP Phase 1, each generation project advancing to GIP Phase 2 must elect either (A) – project requires TPP-based deliverability; or (B) – project is willing to pay for delivery network upgrades.
3. The requirement for customer-funding of network upgrades (option (B)) would apply only to delivery network upgrades (DNU); posting and reimbursement for reliability network upgrades (RNU) for all projects would remain as today.
4. The allocation of TPP-based deliverability to generation projects would occur after GIP Phase 2, rather than after Phase 1 as in the previous proposal.

5. Allocation of TPP-based deliverability – and project’s ability to retain allocation – will depend on the project’s completion of significant development milestones that demonstrate high confidence in attaining COD. (Specification of appropriate milestones is covered in the next section.)
6. The allocation of TPP-based deliverability should achieve the following objectives as far as possible: (a) select projects with high probability of completion; (b) limit ability of non-viable projects to retain the allocation; (c) provide sufficient certainty to enable financing of viable projects; (d) objectivity and transparency.

Section 2. Details of individual elements of the proposal.

GIP Phase 1

7. For extremely large cluster groups compared to the amount of “TP deliverability” (the amount supported by existing grid plus all approved upgrades to date), GIP phase 1 will study deliverability in each area up to the amount of TP deliverability plus a reasonable margin. The intent is to avoid excessive DNU costs that can result from extremely large clusters, while providing useful information on needed DNU and associated costs if generation development exceeds grid capacity.
8. Phase 1 will study RNU for all projects in the cluster.
9. As a result of Phase 1 each project will know its RNU and associated costs, and these results will establish cost caps for RNU as they do today.

LS Power generally agrees with the proposal that RNUs continue to be studied as they are today in Phase 1. LS Power does suggest that CAISO should look at the possibility of separating RNUs that are triggered due to Deliverability Upgrades that are required to interconnect FC projects, e.g. Circuit Breaker upgrades due to a new transmission line DNU from those RNUs that are solely required to interconnect the project e.g., requiring a new loop in station or expanding an existing station. The cost for RNUs that are triggered by Delivery Network Upgrades should be excluded from the cost estimates and security posting requirements for Phase 1.

10. The DNU and associated costs resulting from phase 1 will be advisory. The only formal use of Phase 1 DNU costs in the TPP-GIP process will be to establish posting requirements for projects advancing to phase 2 under option (B), as described below.

Project’s Decision to Enter Phase 2 and Implications of Decision

11. After GIP Phase 1, each generation project advancing to GIP Phase 2 must elect either (A) – project requires TPP-based deliverability; or (B) – project is willing to pay for delivery network upgrades. Once a project chooses and the deadline for phase 2 is passed, the project cannot switch to the other option.

It is not clear if the proposal will allow a project to proceed with only partial deliverability. For instance, if a 100 MW project elects Full Capacity under Selection (A), and if the studies can allow for only 50 MW to be deliverable using TPP based transmission, can the project proceed to GIA with 50 MW partial deliverability status. If the proposal does not include this concept, ISO should consider including it.

12. A project choosing (A) will have to post for its RNU under today's rules, but not for DNU.
13. A project choosing (B) will have to post for both RNU and DNU. Its DNU posting amount will use phase 1 results for the project's study area, converted to a DNU rate (\$ per MW of deliverability) = (cost of incremental DNU)/(deliverability MW studied above TP deliverability amount). The posting amount will = rate x (project MW), where project MW reflects how the project is modeled in the deliverability study depending on the resource type, would typically be less than nameplate for renewables.
14. A project choosing (B) will be eligible for TPP-based deliverability if available, but should expect very low probability of obtaining it and should plan to fully fund its needed DNU.

The proposal describes that Customers choosing Option (B) will be allowed to choose their preferred developer and build DNUs. At the stakeholder meeting, there was discussion around the challenges associated with Independent Developers building such transmission. More details should be included in the next proposal on this, how this track can be clearly defined such that it allows opportunities for both Independent Generation Developers and Transmission Developers, under Option (B).

GIP Phase 2

15. ISO will perform a baseline re-study at the start of each phase 2 study process. The re-study will assess impacts of status changes – project drop-outs or revised COD, new transmission expansion approvals, etc. As a result, the RNU or DNU for some projects may be modified and their GIAs revised.

Every effort should be taken to minimize delays the re-study can cause to projects which continue to meet all GIP milestones and stay in the queue. Also, re-study should not increase the cost exposure for these projects, and their Phase 1 cost caps should still hold.

16. Phase 2 will study RNU for all projects in phase 2.
17. Phase 2 study will assume that all TP deliverability is used up by (A) projects and existing queue, and then will model (B) projects at requested deliverability status to assess their incremental DNU needs.

Allocation of TPP-based Deliverability

18. Once phase 2 results are completed and provided to the projects, the 120-day period for negotiating and executing the GIA begins. Option (A) projects that demonstrate

completion of certain milestones within this period will be able to execute GIAs at their requested deliverability status, with no cost responsibility for DNU. Option (B) projects that complete the same milestones would be eligible for TPP-based deliverability, but would receive an allocation only if capacity is available.

19. The proposed milestones required are (a) completion of all permitting required to begin project construction, and (b) either a PPA approved by buyer's regulatory authority or demonstration of committed project financing. PLEASE COMMENT on whether these milestones are appropriate, or if not, what milestones would be preferable and explain why. Please keep in mind the objective that milestones must provide a high confidence that the project will meet its planned COD.

We support the intent of having some milestones for TPP transmission allocation; however, as proposed, meeting these milestones could be unrealistic for most projects. Milestones need to be established that are well defined and within a project's control – such as applying for all permits vs receiving all permits, as developers have no control over that timing once applications are made. ISO should include more details on these proposed milestones in the next proposal, based on comments received at the stakeholder meeting; and we encourage more discussion on this at the next stakeholder meeting.

20. PLEASE COMMENT on what could constitute evidence of committed project financing as an alternative to regulator-approved PPA for item (b) above.

21. All option (A) projects that meet the milestones by the time required would be able to execute FC GIAs at this time, even if the total amount exceeds the TP deliverability available. In that case, the ISO would expand the TPP planning portfolio in that area for the next TPP cycle, to provide sufficient deliverability.

22. Any project that obtains TPP-based deliverability would have additional milestones in its GIA which track progress toward COD. Failure to meet one of these milestones would cause the project to lose its deliverability allocation, but would not necessarily terminate its GIA if the project wishes to continue as EO.

ISO should include more details on specifics of these milestones in the next proposal, so we can offer feedback on this topic.

23. An option (A) project that does not meet the milestones by the time required would have an opportunity again in the next GIP phase 2 cycle, one year later. If it does not qualify by the end of the next year's 120-day GIA period, it must either withdraw from the queue or continue under an Energy Only (EO) GIA.

24. An option (B) project that does not obtain TPP-based deliverability in the current cluster cycle (120 days from phase 2 results to GIA execution) will no longer be eligible for TPP-based deliverability and must proceed to GIA that includes full self-funding of its DNU.

25. If a (B) project drops out after phase 2 instead of executing a GIA that includes self-funding of its DNU, it loses a portion of its posting. PLEASE COMMENT on how much of the posting should be forfeited, and explain your logic.

Other Proposal Elements

26. DNU paid for by an interconnection customer would fall under the merchant transmission provisions of the ISO tariff and would be eligible for allocation of congestion revenue rights commensurate with the capacity added to the ISO grid. The customer would be able to select a non-incumbent PTO to build the project, provided it is a “green field” project and the builder meets qualifications specified in the ISO tariff.

Allocation of CRRs under the Merchant Transmission provisions is often not attractive enough for Independent Transmission Development. Unless more options are explored, building merchant transmission will be merely a theoretical possibility.

27. If a (B) project funds DNU that provide more capacity for deliverability than the project needs, the funding party or parties would need to fully pay for the DNU, but would receive reimbursement for the excess deliverability from later projects that are able to use it.
28. Some projects that go forward under these new provisions could be subject to reduction in annual net qualifying capacity (NQC) for one or more years. This could occur if transmission capacity in an area must be expanded through the TPP to accommodate the amount of deliverable capacity that achieves COD in that area. Consistent with the ISO’s January 10 discussion paper on cluster 1-2 approach, “existing” projects would not be subject to the reduction, but “new” projects would be. “New” would include all cluster 5 and later projects that elect option (A).
29. It was suggested by some stakeholders at the January 19 meeting that as an alternative to applying NQC reductions if the need arises, the ISO should allow the new projects to count fully for resource adequacy without any NQC reduction so that the projects and the LSE buyers are insulated from any direct impacts, and then make up for any resulting shortfall in resource adequacy capacity via ISO backstop capacity purchases. PLEASE COMMENT on this proposal.
30. Please use the space below to offer comments on any other aspect of the proposal not covered above.

Transition Issues: While the proposal states that it applies only to Clusters 5 and beyond, it some areas in the proposal seem to also address earlier clusters. For instance, Item 17), Over building transmission, the proposal describes NQC reduction for “new” projects, where “new” projects are defined as including Cluster 1 to 4 projects that have not achieved development milestones. In the next round of proposal, we request IDO to clarify what sections of this proposal, if any, also apply to projects before Cluster 5.
