HIGH TEMPERATURES PROMPT STAGE ONE ELECTRICAL EMERGENCY Cal-ISO Urges Californians to Conserve Energy

(Folsom, CA) The California Independent System Operator (Cal-ISO) is declaring a Stage One Emergency as the state's electric system responds to today's sizzling hot summer afternoon. The Cal-ISO is asking customers to voluntarily reduce their use of electricity, to prevent more severe curtailment measures. The Stage One Emergency is in effect until 6 p.m. tonight. The demand on the transmission system had already reached over 45,000 megawatts at approximately 2:30 PM today, exceeding last year's record of 44,927 megawatts.

Stage One of the state's Electrical Emergency Plan is initiated to advise the public of potential power shortages and to ask all customers to conserve electricity to ensure there will be enough power to meet future demand. The request for demand reduction is not intended to disrupt employment or curtail industrial production or commerce. However, if the conservation measures are insufficient in lowering the demand for power, load management programs that implement voluntary curtailments of power are probable. The Cal-ISO's Electrical Emergency Plan (EEP) is part of the state's enhanced reliability standards enacted by landmark legislation Assembly Bill 1890 that led to the restructuring of California's electricity industry.

-MORE-

STAGE ONE-2-2-2

A Stage One Emergency takes effect when electricity operating reserves fall to below seven percent. A Stage Two is declared when reserves drop below five percent. At this level, large commercial customers that have signed up to voluntarily curtail power during high demand days will be asked to do so. If an operating reserve shortfall of less than one-and-a-half percent is unavoidable, Stage Three is initiated. Involuntary curtailments of service to customers including "rolling blackouts" are probable during this emergency declaration.

Cal-ISO is chartered by the state to manage the flow electricity along the long-distance, high-voltage power lines that make up the bulk of California's transmission system. The not-for-profit public-benefit corporation assumed the responsibility in March 1998 when California opened its energy markets to competition and mandated the investor-owned utilities turn their private transmission power lines over to the Cal-ISO's public power grid. The mission of the Cal-ISO is to safeguard the reliable delivery of electricity and ensure equal access to the state's "electron highway", which spans 124,000 miles or three-quarters of the state. The Cal-ISO is the second largest control area in the U.S. and the fifth largest in the world.
