# Overview – NGR Phased Approach

# Overview – NGR/REM

Regulation Energy Management (REM) for a Non-generating Resource (NGR) is an important market enhancement that enables new types of resources to participate the ISO regulation markets.

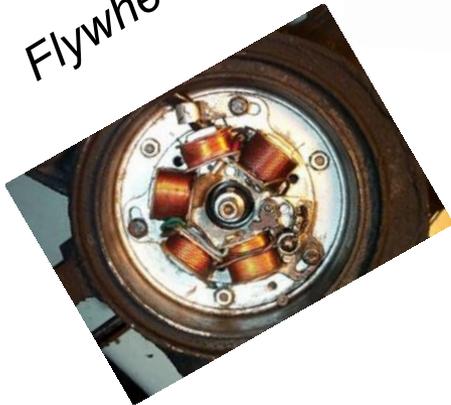

The implementation of Non-generator Resources will:

- Create the initial model for energy storage devices to fully participate in ISO markets – *Phase I*
- Enable Dispatchable Demand Response to participate in Regulation – *Phase II*

# Overview - NGR/REM

- NGR - Non Generating Resources
  - LESR – Limited Energy Storage Resource – Phase I

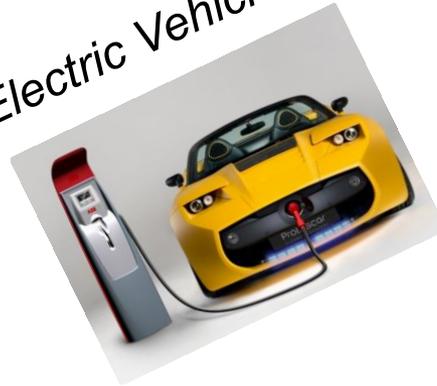

Flywheel

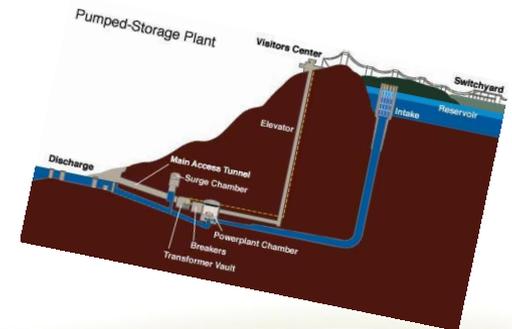

Lithium ion battery

Electric Vehicles

Pumped hydro

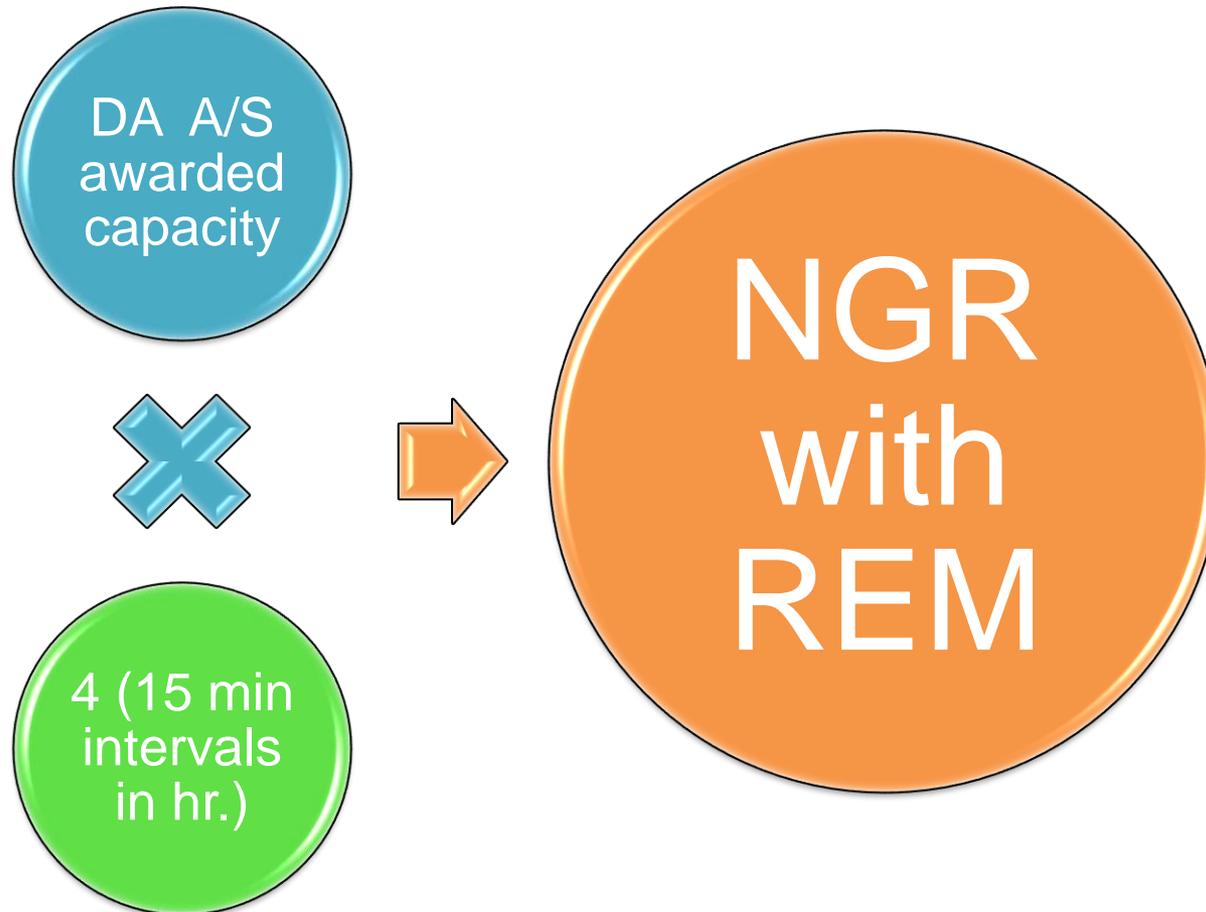

# Overview - NGR/REM

## Regulation Energy Management (REM)

- Enhancement of the ISO's current rules for regulation
- Allows NGR resources to bid their capacity more effectively into the ISO's regulation markets
- Maintain compliance with NERC/WECC

# Overview - NGR/REM

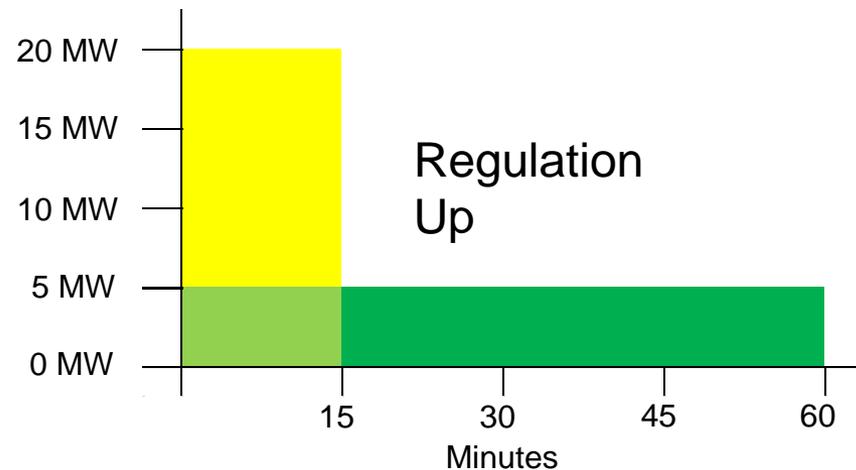

# Overview - NGR/REM

- Limited energy storage resources were unable to participate in *day-ahead* regulation market at full capacity w/o regulation management (REM)

*Example: 20 MW / 5 MWh  
limited energy resource*

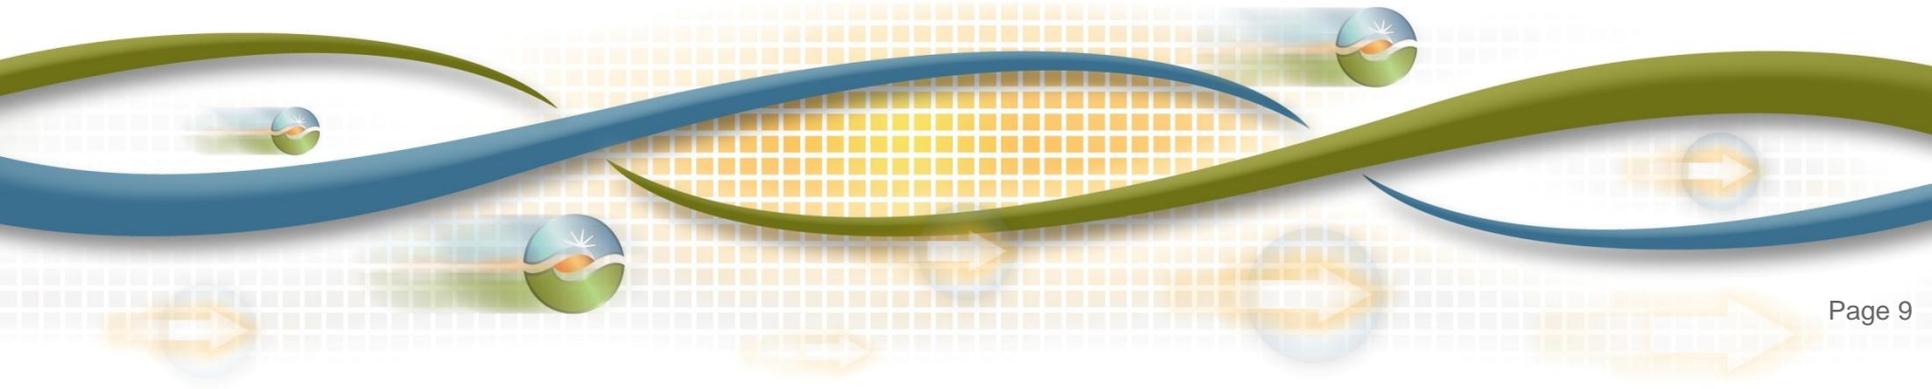

*Green – prior requirement*

*Yellow – regulation energy  
management*

# NGR/REM

Participation

# Participation - NGR/REM

- To participate as NGR resource the CAISO will use existing business processes and agreements
  - Scheduling Coordinator
  - Participating Load Agreement (PLA)
  - Participating Generator Agreement (PGA)
  - Metered Entity
  - Resource Data Template (RDT) -  
<http://www.caiso.com/Documents/Regulation%20energy%20management%20-%20implementation>

# NGR/REM

Phase 1

NGR/ REM Modeling

# Phase 1 - NGR/REM - Modeling

- Phase one of the ISO's market simulation includes the deployment of the base non-generator resource model for regulation energy management.
- NGR with REM (NGR/REM) is a subset of NGR resources.

# Phase 1 - NGR/REM - Modeling

## Non-Generator Resource (NGR) and NGR with REM option

Project	Technology	Model	Option to REM (Special Treatment)	Regulation	Spin/Non-Spin	Energy	Qualified MW
<b>Non-Generator Resource (NGR) (2012)</b>  <b>Phase I</b>	Limited Energy Storage Resource (LESR) (Flywheel, battery, energy storage)	Operation range between negative (Charge) and positive (Discharge), constrained by State of Charge (SOC)	REM	SC Bid	No	No	15 minute continuous delivery
			Non REM	SC Bid	SC Bid	SC Bid	Depending on registration and certification

# Phase 1 - NGR/REM

## Certified maximum capacity - REM or Non REM

### Example:

Resource 1: LESR 10 MWH (4 - 15 min. intervals in hour)

$P_{max} = 40$  MW,  $P_{min} = -40$  MW. Ramp rate = 10 MW/min

MW	REM	Non REM
Regulation Up	40	10
Regulation Down	40	10
Spinning	n/a	20
Non-Spinning	n/a	20
$P_{max}$	40	40
$P_{min}$	-40	-40

# Phase 1 - NGR/REM – Modeling

1. NGR is modeled as a generator on positive (generation) and/or negative (consuming energy/load)
2. NGR can be dispatched seamlessly within their entire capacity range.
3. NGR are also constrained by an energy (MWh) limit to generate or consume energy on a continuous basis.

## **NGR with REM option**

1. NGR can elect to participate only in the ISO's regulation markets.
2. The regulation capacity awarded in the day-ahead market is evaluated as 4 times the regulation energy it can provide within 15 minutes.
3. REM functionality will offset (purchase or sell) energy in real-time to meet the continuous energy requirements for regulation.

# Phase 1 - NGR/REM - Modeling Ancillary Services (A/S) Procurement

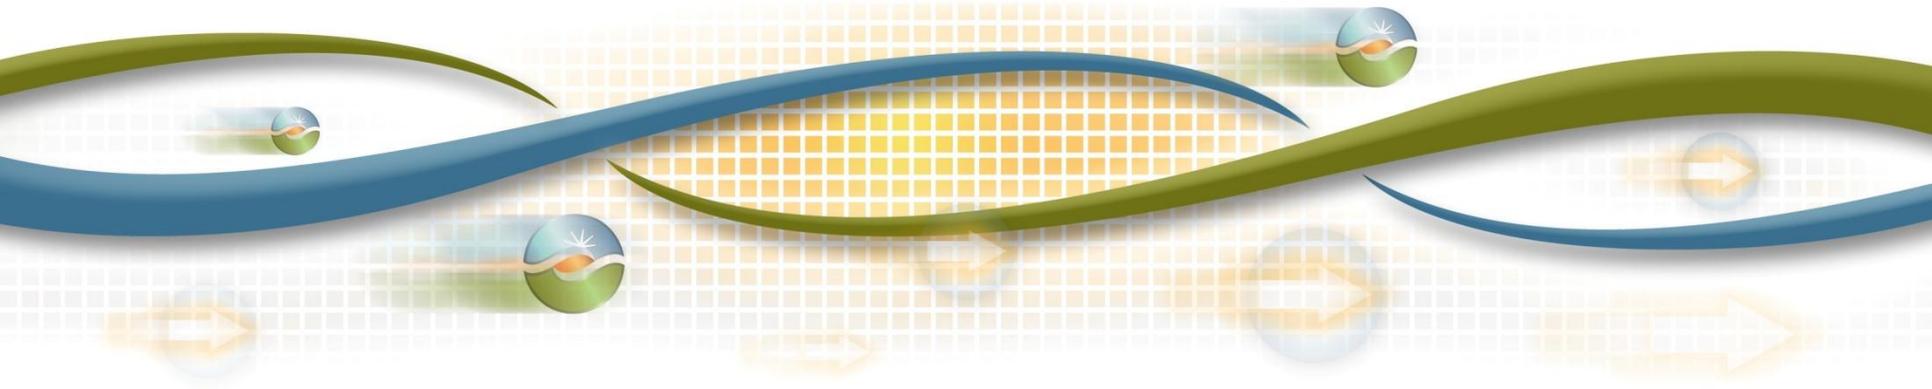

CAISO procures 100% of our A/S requirement on an hourly basis in the Day-ahead market.

- Minimum continuous energy A/S procurement requirement for NGR and NGR/REM:
  - Day-Ahead Regulation Up/Down: 60 minutes
  - Real-Time Regulation Up/Down: 30 minutes
  - Spin and Non-Spin: 30 minutes
- Minimum continuous energy measured from the period that the resource reaches the awarded energy output
  - Measurement starts once resource reaches awarded energy, not end of 10 minute ramp requirement

# NGR/REM

Phase 1

Determining Capacity

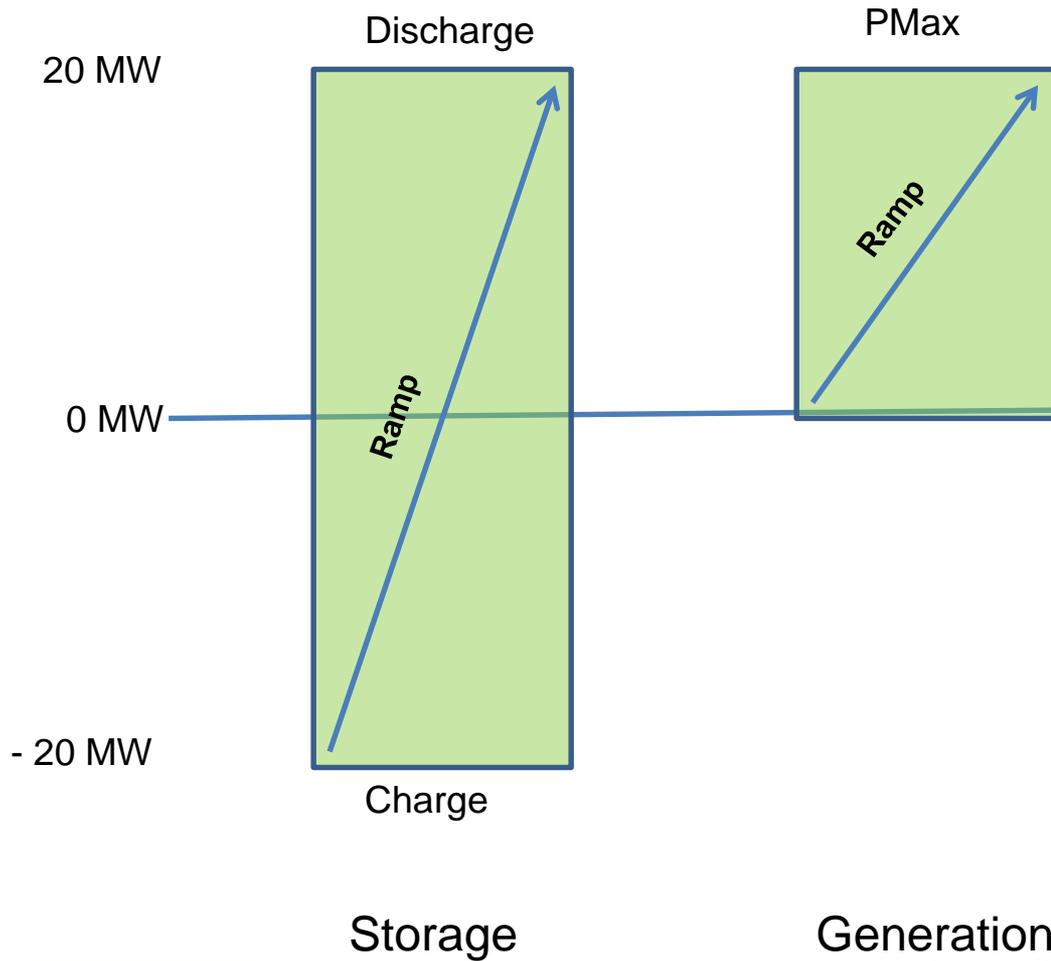

## Phase 1 - NGR/REM

### Determining capacity - REM or Non REM

- The ISO shall conduct the regulation certification process
- NGR-REM must meet 10 minute ramping requirement, same as generator
- Regulation up capacity must meet the 15 minute continuous energy deliver requirements – fully charged
- Regulation down capacity must meet the 15 minute consumption of continuous energy requirements – fully discharged

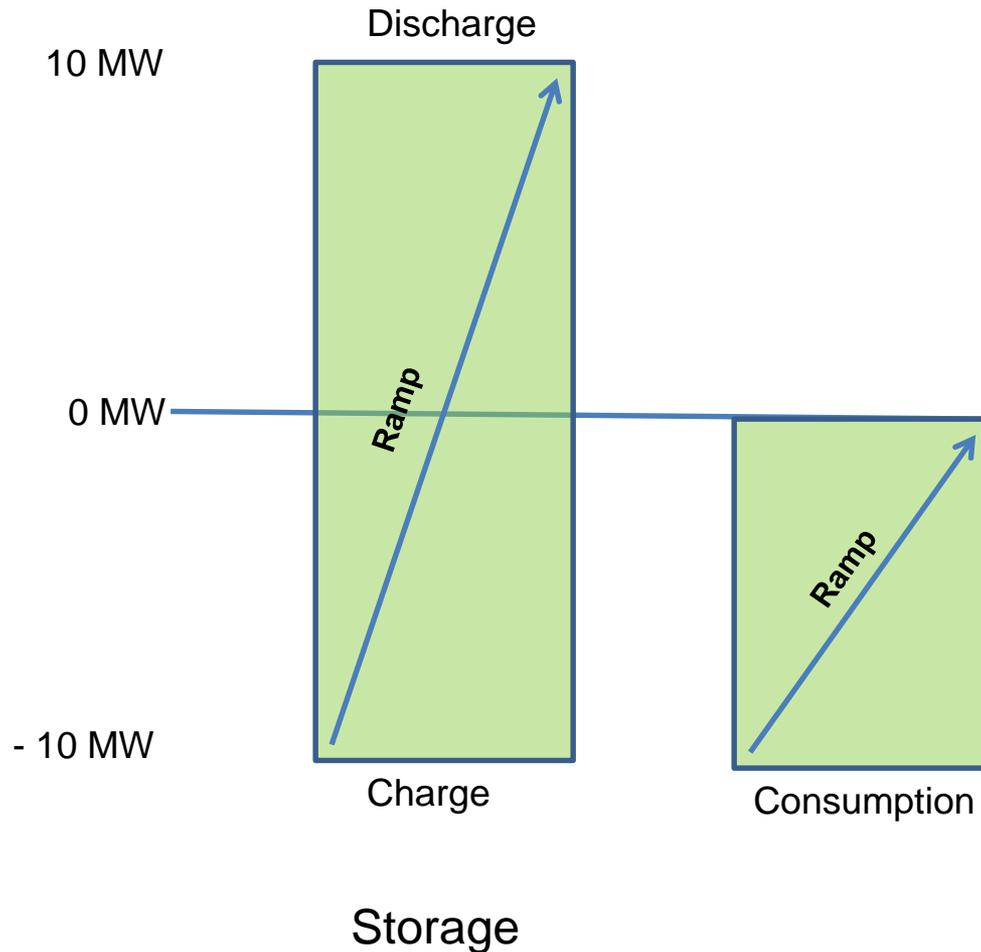

# Phase 1 - NGR/REM

## Example – Fully charged 5 MWh Storage

# Phase 1 - NGR/REM

Example – Completely discharged 2.5 MWh Storage

## Phase 1 - NGR/REM

### Determining capacity - REM or Non REM

- NGR (Non REM) will be subject to existing ISO requirements for the traditional generators
- To certify the capacity for regulation, spinning, non-spinning and maximum capacity must be dispatchable on a continuous basis for at least 60 minutes

# Phase 1 - NGR/REM

## Certified maximum capacity - REM or Non REM

### Example:

Resource 1: LESR 10 MWH (4 - 15 min. intervals in hour)

$P_{max} = 40$  MW,  $P_{min} = -40$  MW. Ramp rate = 10 MW/min

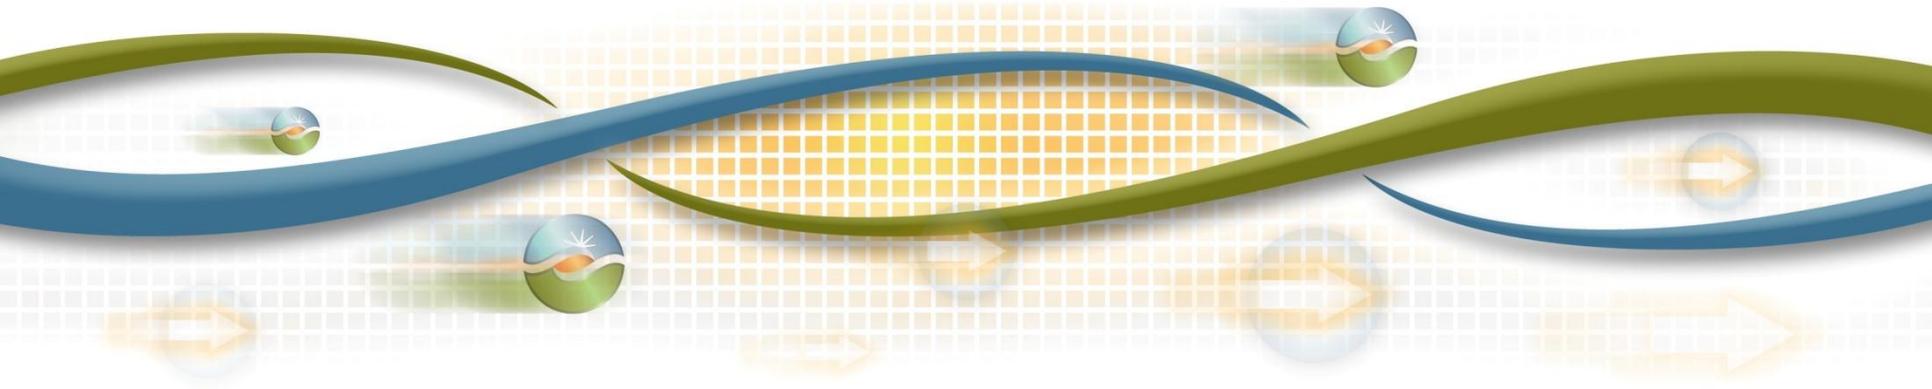

MW	REM	Non REM
Regulation Up	40	10
Regulation Down	40	10
Spinning	n/a	20
Non-Spinning	n/a	20
$P_{max}$	40	40
$P_{min}$	-40	-40

# NGR/REM

Phase 1

DAM - Day-Ahead Market

RTM - Real Time Market

# Phase 1 - NGR/REM

## Day-Ahead and Real-Time Markets

- Optimize NGR energy and A/S awards in DAM/RTM subject to:
  - Capacity Constraints;
  - Ramping Constraints;
  - State of Charge (SOC) constraints for LESR;
- NGR optimal schedule and A/S awards shall be based on its energy bid curve and A/S bids.
- For LESR (REM), SOC constraint is enforced in the RTD. IFM and RTPD shall not include SOC constraints

# Phase 1 - NGR/REM

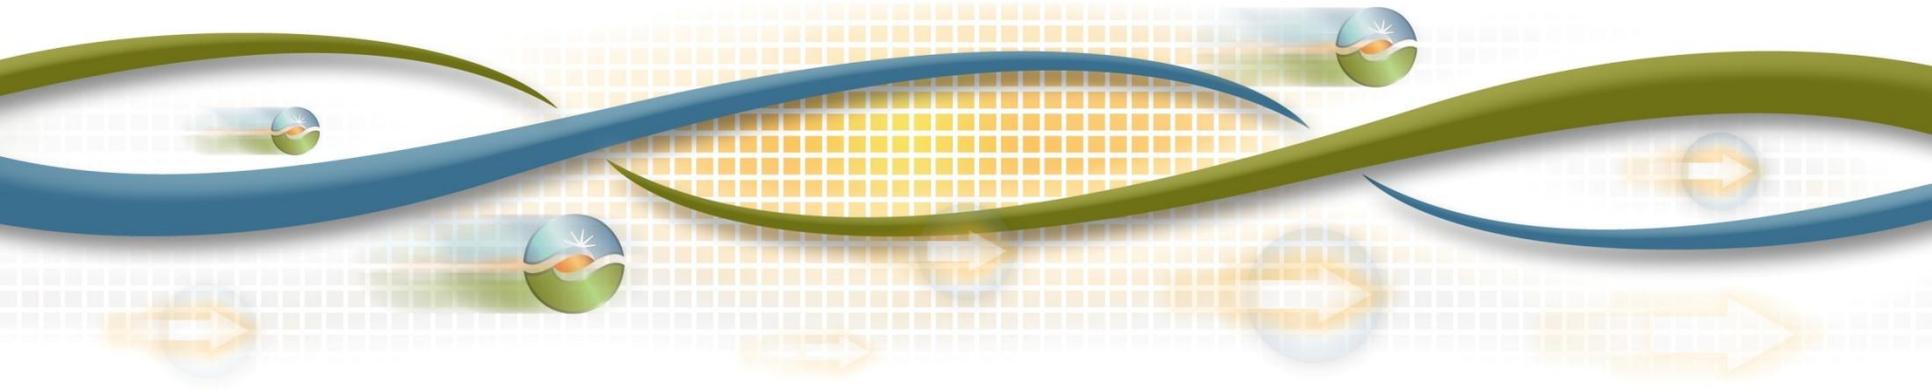

## Day-Ahead and Real-Time Markets

- DAM/RTM will model NGR with energy and/or A/S bids as on-line unit; No start up cost /time, No commitment cost recovery.
- DAM will assume LESR (Non REM) SOC initial state determined by prior day's day-ahead schedules at the end of the day.

# NGR/REM

Phase 1

Energy Management System (EMS)

# Phase 1 - NGR/REM Energy Management System (EMS)

- EMS shall receive NGR telemetry of the following data every four (4) seconds and send to the RTM every minute:
  - Resource Instantaneous Output (MW);
  - For LESR, State of Charge (SOC), which is the actual stored Energy (MWh) in the device;

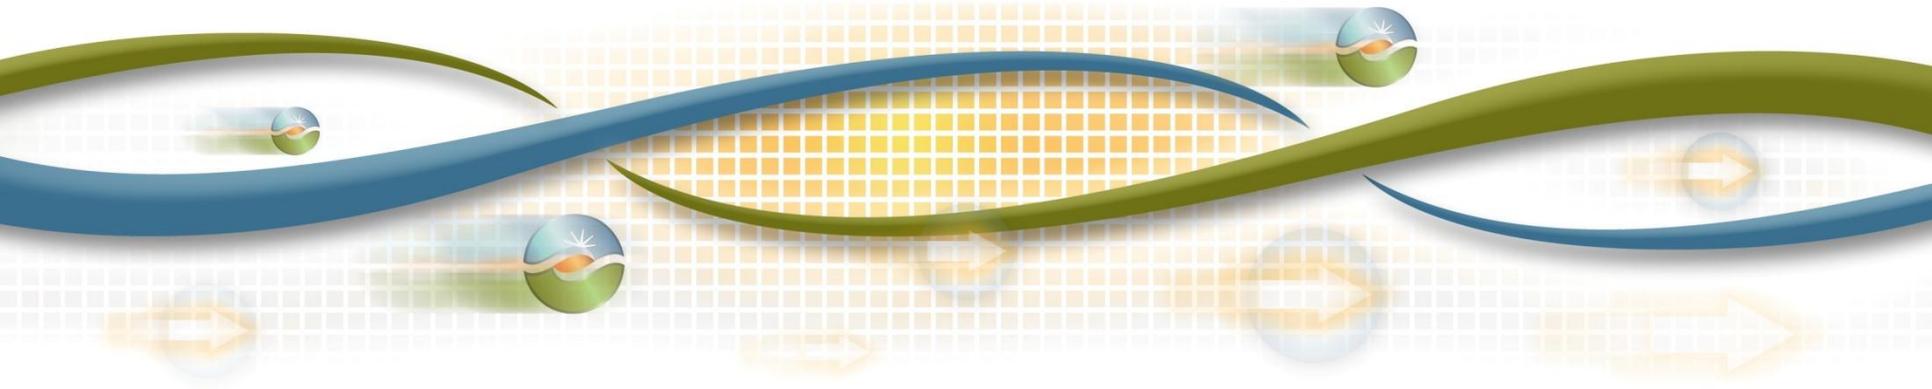

# Phase 1 - NGR/REM

## Energy Management System (EMS)

- EMS shall model NGR as a generation resource with supply range of negative to positive.
  - For LESR
    - Ex: A battery is discharging at 2 MW, the operation output will be 2MW.*
    - A battery is charging at 2 MW, the output will be -2 MW.*
- EMS shall control NGR regulation up and down through Automatic Generation Control (AGC) based on NGR Dispatch Operating Target (DOT)
  - NGR provides regulation up if AGC dispatches the NGR above its DOT
  - NGR provides regulation Down if AGC dispatches the NGR below its DOT

# NGR/REM

Phase 1  
Settlements

# Phase 1 – NGR/REM Settlements

- NGR/REM shall be subject to all existing A/S No Pay categories.
- All energy will be still calculated based on algebraic difference between different MWs.
  - For example, a DOT of 7MW with a DA schedule of -3MW will possibly result in Optimal Energy of 10MW;
- Energy settlement are still based on resource level Locational Marginal Prices (LMP) and resource MWs. A decrease in energy off the CAISO grid normally results in a charge. An increase in energy onto the CAISO grid normally results in a payment.

# Phase 1 – NGR/REM Settlements

- CG CC 6474 Real-Time Unaccounted for Energy Settlement
- CG CC 6490 MER WECC Charge
- CG PC Metered Demand TAC Area and CPM
- CG PC Measured Demand Black Start Excluding Exports
- CG PC HVAC Metered Load
- CG PC Measured Demand Emissions Over Control Area
- CG PC Measured Demand Over Control Area Excl Transmission Loss
- CG PC Measured Demand Over Control Area Excluding MSS Energy
- CG PC Measured Demand Over Control Area
- CG PC MSS Netting
- CG PC Real-Time Energy Quantity
