</tbody>
</table>
| 6/12/24  | 1.2  | BRQ-001:  
  - Add requirement to pass RTCommitment payload records where Interval Start (which is the binding interval of mkt run) >= Instruction Interval Start  
  - Clarification: Interval Start = binding interval of RTUC market run (interval 2 in RTUC horizon)  
  
  BRQ-017: Two BRQ-017s were identified in Section 4.3.1 of the BRS. The first instance was re-named BRQ-020.  

  BRQs 045 + 046:  
  - Remove requirement to provide Instruction Cost data element in Report UI + B2B web service (non-applicable for reporting use)  
  - Note: StartUpShutDownInstructions_v2 XSD will change InstructionCost from a mandatory to optional data element since it will not be provided under the new RTUC enumeration of the existing service  
  - Clarification: Interval Start field defines the binding interval of the RTUC market run that instructed the advisory shutdown (which is the 2nd interval) |
| 6/21/24  | 1.3  | Standard disclaimer provision. |

1 Introduction

1.1 Purpose

The California ISO will implement system changes regarding Tariff Section 11.17.2.1 (“Disqualification Based on Advisory Schedules”). Due to a missing data parameter in the settlements system, this section, which went into effect in 2014, was never implemented fully. The CAISO is now addressing that issue by creating the missing parameter and implementing other related system updates.

Tariff section 11.17.2.1 disqualifies resources from being credited for minimum load costs (MLC) in the bid cost recovery (BCR) calculations based on the relationship between a resource’s dispatch operating point, minimum load, and the value of a term called the “Shut-Down State Variable.”

The resource shutdown state variable is a mechanism used to track a resource’s positive Uninstructed Imbalance Energy (+UIE) once it receives an advisory shutdown instruction. For resources not following their shutdown instruction, it provides the cumulative MWh over those Real-Time Unit Commitment (RTUC) intervals.

This project addresses a current inability of the market to successfully transmit advisory shutdown instructions, and for Settlements to create a corresponding advisory shutdown flag that is then used as an input to the existing MLC disqualification rules in section 11.17.2.1.

This compliance implementation will include the following deliverables:

1) RTM publishing of advisory shutdown instruction to downstream systems
2) Enhancement to the Settlement system so it can receive the published advisory shutdown instructions needed to create an advisory shutdown flag input for its existing MLC disqualification assessment formulas for resources.
3) Published reports to alert those Scheduling Coordinators with resources receiving an advisory shutdown
4) An after-the-fact internal ISO monitoring report to ensure no manipulation of the MLC disqualification occurs prior to, and after, implementation of the compliance action
2 Details of Business Need/Problem

2.1 Description

<table>
<thead>
<tr>
<th>Business Opportunity/Problem Statement:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>What:</strong> Tariff section 11.17.2.1 (“Disqualification Based on Advisory Schedules”) disqualifies resources from receiving relevant Minimum Load Costs with their calculated Bid Cost Recovery for a period when a resource receives an advisory shutdown instruction while its Dispatch Operating Point minus its shutdown state variable is at or below its registered Minimum Load. MLC reinstates within the BCR calculation once the variable resets during completed shutdown.</td>
</tr>
<tr>
<td><strong>When:</strong> Independent 2024 release. Please refer to the Release Users Group (RUG) postings for specific timelines.</td>
</tr>
<tr>
<td><strong>Why do we have this opportunity/problem:</strong> Determination of the Minimum Load Cost (MLC) Disqualification was determined to be in error, requiring immediate correction in order to meet compliance with Tariff Section 11.17.2.1.</td>
</tr>

4 Business Requirements

The sections below describe the business processes and the associated business requirements involved in the project. These may represent high-level functional, non-functional, reporting, and/or infrastructure requirements. These business requirements directly relate to the high-level scope items determined for the project.

4.1 Business Process: Real-Time Markets

4.1.1 Business Requirements

Advisory Shutdown MLC Disqualification in Bid Cost Recovery
Business Requirements Specification

ID# | Business Feature | Req Type | Potential Application(s) Impacted
---|------------------|----------|-----------------------------
ADVSD-BRQ019 | System shall flag resource shutdown instructions in the advisory period, excluding the energy binding interval of the payload horizon, such that the resource advisory shutdown flag will be set as follows:

- 1: (Advisory Shutdown exists) when Interval Start Time < InstructionStartTime
- 0: (no Advisory Shutdown exists) when Interval Start Time >= InstructionStartTime

Implementation Notes:
- Logic is used to populate the BD, BA_5M_RSRC_ADVISORY_SHUTDOWN_FLAG
- For each resource in an RTUC run output, create this flag with a value of 1, if there is an advisory shutdown for the resource within the RTUC horizon. Otherwise, the flag value is zero, or not created at all.
- Always associate this flag to RTPD (energy) binding interval timeframe, i.e., the three five-minutes corresponding to that binding interval timeframe of the RTUC run.
- Binding shutdowns do not count since not considered advisory.
- The instruction time of advisory shutdown can be within the RTUC run horizon or beyond.

ADVSD-BRQ026 | If receiving a correction record, system shall perform the correction to the following bill determinant:

BA_5M_RSRC_ADVISORY_SHUTDOWN_FLAG

Core

Tariff:
§11.17.2.1

Settlements
### Advisory Shutdown MLC Disqualification in Bid Cost Recovery

<th>Potential Application(s) Impacted</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADVSD-BRQ017</td>
<td>System shall disqualify any resource’s relevant Minimum Load Cost (MLC) from Bid Cost Recovery (BCR) during the period from its first dispatch interval in which Dispatch Operating Point (DOP) minus shutdown state variable <em>is less or equal</em> to minimum load <em>until</em> the shutdown state variable is reset.</td>
<td>Existing</td>
<td>Settlements</td>
</tr>
<tr>
<td></td>
<td>Reset of shutdown state variable occurs when its resource dispatch no longer has an advisory shutdown instruction within its RTM dispatch horizon or when the resource has an offline status.</td>
<td>Tariff: §11.17.2.1</td>
<td></td>
</tr>
</tbody>
</table>
| ADVSD-BRQ018 | Effective once an advisory shutdown instruction is issued to a resource, system shall track resource’s positive uninstructed imbalance energy (+UIE). System shall determine the accumulated +UIE *once* there is an advisory shutdown instruction in the RTM dispatch horizon *until* either: resource status is offline, or metered energy - regulation energy - expected energy > performance metric tolerance band  

*Note:* A scenario may occur when an advisory interval with shutdown instructions does not maintain its status when the interval is finally binding due to revised optimization results. In this scenario, the shutdown state variable will be reset. | Existing  | Settlements                      |

4.5 Business Process: Market/Business Simulation

This section shall provide a basis for the development of the Market/Business Simulation Scenarios. These requirements will provide guidance on the market participant impacts, inputs into the Scenarios, endpoints to the Scenarios and reasons for potential Scenarios.

The Reason for the Potential Scenario column will offer guidance regarding what potential scenarios, and their context, may be needed for this project. This section applies to all policy development projects, market enhancements, technology enhancements, operation enhancements, Energy Imbalance Market (EIM) implementations, and Reliability Coordination (RC) service implementations. If the project team has deemed that no structured testing is needed, an end-to-end test case must be specified.

In the Reason for Potential Scenario column, select one or more of the following reasons:

1. **Rule impacts**: Generalized changes in market rules, bidding rules, settlements rules, market design changes, or other business rules.

2. **Interface changes**: Changes that impact templates (e.g., the Resource Adequacy (RA) supply plan), user interface (UI), and application programming interface (API) (e.g., retrievals of new shadow settlement data).

3. **New application/report**: Changes that cause addition/modification of market software or reports, especially when market data input is required by the market participant.

4. **New system process**: Modification of data flow in systems, especially if the new process requires the market participant to demonstrate proficiency prior to production.

5. **New/Modified model data**: Addition or substantial modification of model data as a market solution or export provided by the ISO.

6. **New user role**: The addition or modification of access permissions for a user role applied to specific business units within an EIM entity or market participant organization (e.g., Load Serving Entity (LSE) as a Local Regulatory Authority (LRA) role). Scenarios are beneficial for market participants taking on a new function or process within their organization.

| ADVSD-MSIM-001 | Unstructured Test Scenario: Generator receives advisory shutdown instruction for one of its generator resources and settles appropriately.  
- Prior to T-1 1000 Hrs (day before trade date at 10am), SC submits IFM and RTM bids for its portfolio of generator resources  
- Both IFM and RTM markets run for the simulation trade date  
- During a FMM/RTPD run for the simulated trade date, the market instructs an advisory shutdown for one or more of the generators in the portfolio  
- SC receives the advisory shutdown instruction in real-time through the new CMRI report (instead of through ADS)  
- After the simulated trade date is over, the simulation will provide a settlement statement to show the BD BA_5M_RSRC_ADVISORY_SHUTDOWN_FLAG is correctly aligned with the CMRI report. | CMRI Settlements     | External Resource SC | 1. New Interface  
2. New Report  
3. Modified System/Process |

4.6 Business Process: Market Monitoring and Reporting

Prior to implementation of the revised MLC disqualification logic, the CAISO will monitor participant performance to ensure participants are not strategically deviating from dispatch to create MLC that would be disqualified once the appropriate settlement treatment is applied. Behavior determined by the CAISO or the CAISO’s Department of Market Monitoring to reflect such strategic deviations may be referred to FERC’s Office of Enforcement.
