

SCE Operational Practices during Elevated Fire Weather Conditions

Public Safety Power Shutoff (PSPS) Prevent Ignitions During Elevated Weather Conditions

- PSPS is used to pre-emptively de-energize selected circuits in HFRAs during elevated fire weather conditions and is used in conjunction with other wildfire mitigation tactics
- Executed by Incident Management Teams at Emergency Operations Center with real time updates from SCE meteorologists, fire managers, and field electrical workers located at at-risk circuits
- Coordination with local governments, public safety and non-profit organizations, and essential use providers

Our SCE team has been meeting with customers, local government and law enforcement agencies to discuss SCE's Wildfire Mitigation Plan to increase awareness of the possibility of a preemptive power shutoff and discuss enhancing community resilience during major events
