Subject: Generator Interconnection Procedures Straw Proposal and Meeting

We are opposed to coordinating the proposed generator interconnection process with the transmission planning process, because the SGIP process needs to move forward immediately to reduce the barriers to interconnection for small generators. This is particularly crucial in terms of renewable generators such as energy recovery from dairies and other anaerobic digestors. The interconnection needs to be inexpensive and rapid. This is crucial to making our AB 32 GHG goals, especially since the methane has 34 times the GHG impact of CO₂.
